Preface

This Application Deployment Guide describes deployment of applications and application components to the Application Server, and includes information about deployment descriptors.

This preface contains information about and conventions for the entire GlassFish™ Application Server documentation set.

Application Server Documentation Set

The Application Server documentation set describes deployment planning and system installation. The Uniform Resource Locator (URL) for Application Server documentation is http://docs.sun.com/coll/1343.7. For an introduction to Application Server, refer to the books in the order in which they are listed in the following table.

<table>
<thead>
<tr>
<th>Book Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release Notes</td>
<td>Provides late-breaking information about the software and the documentation. Includes a comprehensive, table-based summary of the supported hardware, operating system, Java™ Development Kit (JDK™), and database drivers.</td>
</tr>
<tr>
<td>Quick Start Guide</td>
<td>Explains how to get started with the Application Server product.</td>
</tr>
<tr>
<td>Installation Guide</td>
<td>Explains how to install the software and its components.</td>
</tr>
<tr>
<td>Application Deployment Guide</td>
<td>Explains how to assemble and deploy applications to the Application Server and provides information about deployment descriptors.</td>
</tr>
<tr>
<td>Developer’s Guide</td>
<td>Explains how to create and implement Java Platform, Enterprise Edition (Java EE platform) applications that are intended to run on the Application Server. These applications follow the open Java standards model for Java EE components and APIs. This guide provides information about developer tools, security, debugging, and creating lifecycle modules.</td>
</tr>
</tbody>
</table>
### Related Documentation

A Javadoc™ tool reference for packages that are provided with the Application Server is located at [http://glassfish.dev.java.net/nonav/javaee5/api/index.html](http://glassfish.dev.java.net/nonav/javaee5/api/index.html). Additionally, the following resources might be useful:

- The [Java EE 5 Specifications](http://java.sun.com/javaee/5/javatech.html)
- The [Java EE Blueprints](http://java.sun.com/reference/blueprints/index.html)

For information about creating enterprise applications in the NetBeans™ Integrated Development Environment (IDE), see [http://www.netbeans.org/kb/60/index.html](http://www.netbeans.org/kb/60/index.html).

For information about the Java DB database for use with the Application Server, see [http://developers.sun.com/javadb/](http://developers.sun.com/javadb/)

The GlassFish Samples project is a collection of sample applications that demonstrate a broad range of Java EE technologies. The GlassFish Samples are bundled with the Java EE Software Development Kit (SDK), and are also available from the GlassFish Samples project page at [https://glassfish-samples.dev.java.net/](https://glassfish-samples.dev.java.net/).
Default Paths and File Names

The following table describes the default paths and file names that are used in this book.

<table>
<thead>
<tr>
<th>Placeholder</th>

</table>
### Symbol Conventions

The following table explains symbols that might be used in this book.

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
<th>Example</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ ]</td>
<td>Contains optional arguments and command options.</td>
<td><code>ls [-l]</code></td>
<td>The <code>-l</code> option is not required.</td>
</tr>
<tr>
<td>{</td>
<td>}</td>
<td>Contains a set of choices for a required command option.</td>
<td>`-d {y</td>
</tr>
<tr>
<td>${ }</td>
<td>Indicates a variable reference.</td>
<td><code>${com.sun.javaRoot}</code></td>
<td>References the value of the <code>com.sun.javaRoot</code> variable.</td>
</tr>
<tr>
<td>-</td>
<td>Joins simultaneous multiple keystrokes.</td>
<td>Control-A</td>
<td>Press the Control key while you press the A key.</td>
</tr>
<tr>
<td>+</td>
<td>Joins consecutive multiple keystrokes.</td>
<td>Ctrl+A+N</td>
<td>Press the Control key, release it, and then press the subsequent keys.</td>
</tr>
<tr>
<td>→</td>
<td>Indicates menu item selection in a graphical user interface.</td>
<td>File → New → Templates</td>
<td>From the File menu, choose New. From the New submenu, choose Templates.</td>
</tr>
</tbody>
</table>

## Documentation, Support, and Training

The Sun web site provides information about the following additional resources:

- [Documentation](http://www.sun.com/documentation/)
- [Support](http://www.sun.com/support/)
- [Training](http://www.sun.com/training/)
Searching Sun Product Documentation

Besides searching Sun product documentation from the docs.sun.com™ web site, you can use a search engine by typing the following syntax in the search field:

```
search-term site:docs.sun.com
```

For example, to search for “broker,” type the following:

```
broker site:docs.sun.com
```

To include other Sun web sites in your search (for example, java.sun.com www.sun.com and developers.sun.com), use sun.com in place of docs.sun.com in the search field.

Third-Party Web Site References

Third-party URLs are referenced in this document and provide additional, related information.

**Note** – Sun is not responsible for the availability of third-party web sites mentioned in this document. Sun does not endorse and is not responsible or liable for any content, advertising, products, or other materials that are available on or through such sites or resources. Sun will not be responsible or liable for any actual or alleged damage or loss caused or alleged to be caused by or in connection with use of or reliance on any such content, goods, or services that are available on or through such sites or resources.

Sun Welcomes Your Comments

Sun is interested in improving its documentation and welcomes your comments and suggestions. To share your comments, go to http://docs.sun.com and click Send Comments. In the online form, provide the full document title and part number. The part number is a 7-digit or 9-digit number that can be found on the book’s title page or in the document’s URL. For example, the part number of this book is 820-4502.
This chapter describes Sun Java™ System Application Server web modules and how these modules are assembled. This chapter also describes tools for assembly and deployment.

The Application Server web modules include Java Platform, Enterprise Edition (Java EE platform) standard features and Application Server specific features. Only Application Server specific features are described in detail in this chapter.

The following topics are presented in this chapter:
- “Assembling Web Modules” on page 15
- “Deploying Web Modules” on page 18

Assembling Web Modules

Web application assembly (also known as packaging) is the process of combining discrete components of a web application into a single unit that can be deployed to a Java-EE-compliant application server. Assembly is described in the following topics:
- “About Web Modules” on page 15
- “Java EE Standard Annotation” on page 16
- “Java EE Standard Descriptor” on page 16
- “Application Server Descriptor” on page 17
- “Naming Standards” on page 17
- “Directory Structure” on page 17
- “The NetBeans IDE” on page 17

About Web Modules

A web application or web module is a collection of servlets, HTML pages, classes, and other resources that can be bundled and deployed to several Java EE application servers. A WAR file can consist of the following items: servlets, JavaServer Pages™ (JSP™) files, JSP tag libraries,
utility classes, static pages, client-side applets, beans, bean classes, and annotations or deployment descriptors. In a web application, one descriptor (web.xml) is Java EE standard, the other (sun-web.xml) is optional and Application Server specific. Annotations can be used instead of Java EE standard descriptors.

Package definitions must be used in the source code of web modules so the class loader can properly locate the classes after the modules have been deployed.

Because the information in a deployment descriptor is declarative, it can be changed without requiring modifications to source code. At run time, the Java EE server reads this information and acts accordingly.

**Java EE Standard Annotation**

The Application Server supports web modules annotated according to the following specifications:

The following annotation and deployment descriptor combinations are supported:

- Web modules can be packaged with full Java EE 5.0 compliant standard and runtime deployment descriptors. If the standard deployment descriptors have specified the attribute metadata-complete, annotations in the application or module are ignored.
- Web modules can be fully annotated with metadata defined by the listed specifications. Annotation eliminates the need for Java EE standard deployment descriptors. In most cases, the Application Server deployment descriptors are also optional.
- Web modules can be partially annotated with some deployment information in standard deployment descriptors. In case of conflicts, deployment descriptor values supersede the annotated metadata, but a warning message is logged.

**Java EE Standard Descriptor**

Application Server Descriptor

The Application Server uses an additional, optional deployment descriptor, `sun-web.xml`, for configuring web module features specific to the Application Server.

For a complete description of `sun-web.xml`, see Appendix A, “Deployment Descriptor Files.”

Naming Standards

Names of web applications must be unique within an Application Server domain.

If you do not explicitly specify a name, the default name is the first portion of the file name (without the `.war` extension). This is the case when you use the Admin Console or the `asadmin` command. See “Tools for Deployment” on page 21.

You can specify a name in one of these ways:

- If deploying using the Admin Console, specify the name in the Application Name field.
- If deploying using the `asadmin deploy` command, the default name of the web module is the prefix of the WAR file that you are deploying. For example, for the `hello.war` file, the Web application name is `hello`. To override the default name, specify the `-name` option.

Make sure your package and file names do not contain spaces or characters that are illegal for your operating system.

Using a Java package-like naming scheme is recommended for module filenames. The use of this package-like naming scheme ensures that name collisions do not occur. The benefits of this naming practice apply not only to the Application Server, but to other Java EE application servers as well.

Directory Structure

Web module directory structure follows the structure outlined in the Java EE specification.

The NetBeans IDE

You can use the NetBeans™ Integrated Development Environment (IDE) to assemble web modules. The GlassFish edition of the Application Server is bundled with the NetBeans 5.5 IDE. For more information about using the NetBeans IDE, see http://www.netbeans.org.
Deploying Web Modules

This section describes the different ways to deploy web modules to the Application Server. It covers the following topics:

- “Deployment Errors” on page 18
- “The Deployment Life Cycle” on page 18
- “Deployment for Development” on page 19
- “Tools for Deployment” on page 21
- “Deploying a WAR Module” on page 22

Deployment Errors

If an error occurs during deployment, the web module is not deployed. This prevents a partial deployment that could leave the server in an inconsistent state.

In addition, certain warning conditions allow a web application to be deployed but return a warning message to the deployment client.

The Deployment Life Cycle

After installing the Application Server and starting a domain, you can deploy (install) web modules. During deployment and as the application is changed, a web module can go through the following stages:

1. Initial Deployment
   
   Before deploying a web module, start the domain.
   
   Deploy (install) a web module. Because web modules are packaged in archive files, specify the archive file name during deployment.
   
   You can also deploy using the `asadmin deploy` command or the Admin Console.
   
   Deployment is dynamic; you don’t need to restart the server instance after deploying for web applications to be available. If you do restart, all deployed web modules are still deployed and available.

2. Enabling or Disabling
   
   By default, a web module is enabled, which means that it is runnable and can be accessed by clients if it has been deployed to an accessible server instance or cluster. To prevent access, disable the web module. A disabled web module is not uninstalled from the domain and can be easily enabled after deployment. For more information, see “Disabling a Deployed Application or Module” on page 19.

3. Redeployment
   
   To replace a deployed web module, redeploy it. Redeploying automatically undeploys the previously deployed web module and replaces it with the new one.
4. Undeployment
   To uninstall an application or module, undeploy it.

**Deployment for Development**
This section covers the following topics related to deployment for development:

- “Dynamic Deployment” on page 19
- “Disabling a Deployed Application or Module” on page 19
- “Automatic Deployment” on page 20

**Note** – You can overwrite a previously deployed web application by using the `-force` option of `asadmin deploy` or by selecting the Redeploy button in the Admin Console. However, you must remove a preconfigured resource before you can update it.

**Dynamic Deployment**
You can deploy, redeploy, and undeploy a web module without restarting the server instances. This is called dynamic deployment. Although primarily for developers, dynamic deployment can be used in operational environments to bring new web modules online without requiring a server restart.

Whenever a redeployment is done, the sessions at that transit time become invalid. The client must restart the session.

**Disabling a Deployed Application or Module**
You can disable a deployed web module without removing it from the server. Disabling a web application makes it inaccessible to clients.

To disable a web module using the `asadmin disable` command, see the *GlassFish v3 Application Server Reference Manual*.

▼ **To Disable a Web Module in the Admin Console**

1. Open the Applications component.
2. Go to the Web Applications page.
3. Click on the box to the left of the name of each web module you wish to disable.
4. Click on the Disable button.

**See Also** For details, click the Help button in the Admin Console.
Automatic Deployment

Automatic deployment, also called autodeployment, involves copying a module file (WAR) into a special directory, where it is automatically deployed by the Application Server. To undeploy an automatically deployed web module, simply remove its file from the special autodeployment directory. This is useful in a development environment, because it allows new code to be tested quickly. This feature is available only on the default server instance.

Autodeployment is enabled by default.

▼ To Enable and Configure or to Disable Autodeployment

1 To access autodeployment features:

   ■ In the developer profile:
     a. Select the Application Server component.
     b. Select the Advanced tab.
     c. Select the Applications Configuration tab.

   ■ In the cluster profile:
     a. Select the Stand-Alone Instances component.
     b. Select the instance named server in the table.
        This is the Admin Server.
     c. Select the Advanced tab.

2 Check the Auto Deploy Enabled box to enable autodeployment, or uncheck this box to disable autodeployment.

3 You can change the Auto Deploy Directory.
   You can enter an absolute or relative path. A relative path is relative to domain-dir. The default is domain-dir/autodeploy.

4 Check the Precompile Enabled box to precompile any JSP files.

See Also For details, click the Help button in the Admin Console.
Tools for Deployment

This section discusses the various tools that can be used to deploy web applications. The deployment tools include:

- “The asadmin Deployment Commands” on page 21
- “The Admin Console Deployment Pages” on page 21

The asadmin Deployment Commands

You can use the following asadmin commands to deploy or undeploy web modules on local servers.

- **deploy** — Deploys a web module. If the module is already deployed or already exists, you can force redeployment by setting the **--force** option to true.
- **redeploy** — Redeploys a web module that is already deployed. Whenever a redeployment is done, the sessions at that transit time become invalid. The client must restart the session.
- **undeploy** — Undeploys a web module.
- **disable** — Immediately disables a web module. Disabling a web module makes it inaccessible to clients.
- **enable** — Immediately enables a web module.
- **list-components** — Lists all deployed web modules.

---

**Note** – The **deploydir** command is deprecated.

For details, see the *GlassFish v3 Application Server Reference Manual*.

The Admin Console Deployment Pages

You can use the Admin Console to deploy modules and applications to both local and remote Application Server sites.

▼ To Use the Admin Console for Deployment

1. Open the Applications component.
2. Go to the Web Applications page.
   You can undeploy, enable, or disable an application or module from the table on this page.
3. Click on the Deploy button.
   On this page, you type the path to the WAR file.
For details, click the Help button in the Admin Console.

**Deploying a WAR Module**

You deploy a WAR module as described in “Tools for Deployment” on page 21. If you do not specify a context root, the default is the name of the WAR file without the extension.

If a web application accesses a DataSource that is not specified in a resource-ref in sun-web.xml, or there is no sun-web.xml file, the resource-ref-name defined in web.xml is used. A warning message is logged recording the JNDI name used to look up the resource.

You can keep the generated source for JSP files by adding the -keepgenerated flag to the jsp-config element in sun-web.xml. If you include this property when you deploy the WAR module, the generated source is kept in domain-dir/generated/jsp/app-name/module-name, if it is in an application, or domain-dir/generated/jsp/module-name, if it is in an individually deployed web module.

For more information about JSP precompilation, see “jsp-config” on page 66.

Web module context roots must be unique within a server instance.
Deployment Descriptor Files

This chapter describes deployment descriptor files specific to the GlassFish Application Server in the following sections:

- “Application Server Descriptor” on page 17
- “The sun-web.xml File” on page 24
- “The sun-ejb-jar.xml File” on page 28

Note – For GlassFish v3 Technology Preview 2, web services are not supported unless the optional Metro module is downloaded from the Update Center. Without the Metro module, a servlet or EJB component cannot be a web service endpoint, and the sun-web.xml and sun-ejb-jar.xml elements related to web services are ignored.

EJB modules are not supported unless the optional EJB container module is downloaded from the Update Center. For GlassFish v3 Technology Preview 2, only stateless session beans with local interfaces and entity beans that use the Java Persistence API are supported. Stateful, message-driven, and EJB 2.0 and 2.1 entity beans are not supported. Remote interfaces and remote business interfaces for any of the bean types are not supported. The sun-ejb-jar.xml elements related to these features are ignored.

For information about the Update Center, see the GlassFish v3 Application Server Quick Start Guide.

Sun Java System Application Server Descriptors

GlassFish Application Server uses optional deployment descriptors in addition to the Java EE standard descriptors for configuring features specific to the Application Server.
Note – Settings in the Application Server deployment descriptors override corresponding settings in the Java EE deployment descriptors and in the Application Server’s domain.xml file unless otherwise stated.

Each deployment descriptor (or XML) file has a corresponding DTD file, which defines the elements, data, and attributes that the deployment descriptor file can contain. For example, the sun-web-app_2_5-0.dtd file defines the structure of the sun-web.xml file. The DTD files for the Application Server deployment descriptors are located in the as-install/lib/dtds directory.

Note – Do not edit the DTD files; their contents change only with new versions of the Application Server.

For general information about DTD files and XML, see the XML specification at http://www.w3.org/TR/REC-xml.

The following table lists the Application Server deployment descriptors and their DTD files.

<table>
<thead>
<tr>
<th>Deployment Descriptor</th>
<th>DTD File</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sun-web.xml</td>
<td>sun-web-app_2_5-0.dtd</td>
<td>Configures a web application (WAR file).</td>
</tr>
<tr>
<td>sun-ejb-jar.xml</td>
<td>sun-ejb-jar_3_0-0.dtd</td>
<td>Configures an enterprise bean (EJB JAR file).</td>
</tr>
</tbody>
</table>

Note – The Application Server deployment descriptors must be readable and writable by the file owners.

In each deployment descriptor file, subelements must be defined in the order in which they are listed under each Subelements heading, unless otherwise noted.

The sun-web.xml File

The element hierarchy in the sun-web.xml file is as follows:

sun-web-app
  . context-root
  . security-role-mapping
The sun-web.xml File

Appendix A • Deployment Descriptor Files
The sun-web.xml File

...
Here is a sample sun-web.xml file:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE sun-web-app PUBLIC '-//Sun Microsystems, Inc./DTD Application Server 9.0 Servlet 2.5//EN'
'http://www.sun.com/software/appserver/dtds/sun-web-app_2_5-0.dtd'>
<sun-web-app>
  <session-config>
    <session-manager/>
  </session-config>
  <resource-ref>
    <res-ref-name>mail/Session</res-ref-name>
    <jndi-name>mail/Session</jndi-name>
  </resource-ref>
  <jsp-config/>
</sun-web-app>
```
The sun-ejb-jar.xml File

The element hierarchy in the sun-ejb-jar.xml file is as follows:

```
sun-ejb-jar
  . security-role-mapping
    . role-name
    . principal-name
    . group-name
  enterprise-beans
    . name
    . unique-id
    . ejb
      . ejb-name
      . jndi-name
      . ejb-ref
        . ejb-ref-name
        . jndi-name
      . resource-ref
        . res-ref-name
        . jndi-name
        . default-resource-principal
          . name
          . password
        . resource-env-ref
          . resource-env-ref-name
          . jndi-name
      . service-ref
        . service-ref-name
        . port-info
          . service-endpoint-interface
            . wsdl-port
            . namespaceURI
            . localpart
          . stub-property
            . name
            . value
          . call-property
            . name
            . value
        . message-security-binding
          . message-security
            . message
            . java-method
            . method-name
            . method-params
            . method-param
            . operation-name
```

The sun-ejb-jar.xml File

Appendix A • Deployment Descriptor Files 31
Note – If any configuration information for an enterprise bean is not specified in the `sun-ejb-jar.xml` file, it defaults to a corresponding setting in the EJB container if an equivalency exists.

Here is a sample `sun-ejb-jar.xml` file:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE sun-ejb-jar PUBLIC '-//Sun Microsystems, Inc.//DTD Application Server 9.0 EJB 3.0//EN' 'http://www.sun.com/software/appserver/dtds/sun-ejb-jar_3_0-0.dtd'>
<sun-ejb-jar>
  <display-name>First Module</display-name>
  <enterprise-beans>
    <ejb>
      <ejb-name>CustomerEJB</ejb-name>
      <jndi-name>customer</jndi-name>
      <bean-pool>
        <steady-pool-size>10</steady-pool-size>
        <resize-quantity>10</resize-quantity>
        <max-pool-size>100</max-pool-size>
        <pool-idle-timeout-in-seconds>600</pool-idle-timeout-in-seconds>
      </bean-pool>
      <bean-cache>
        <max-cache-size>100</max-cache-size>
        <resize-quantity>10</resize-quantity>
        <removal-timeout-in-seconds>3600</removal-timeout-in-seconds>
        <victim-selection-policy>LRU</victim-selection-policy>
      </bean-cache>
    </ejb>
    <cmp-resource>
      <jndi-name>jdbc/__default</jndi-name>
      <create-tables-at-deploy>true</create-tables-at-deploy>
      <drop-tables-at-undeploy>true</drop-tables-at-undeploy>
    </cmp-resource>
  </enterprise-beans>
</sun-ejb-jar>
```

**activation-config**

Specifies an activation configuration, which includes the runtime configuration properties of the message-driven bean in its operational environment. For example, this can include
information about the name of a physical JMS destination. Matches and overrides the `activation-config` element in the `ejb-jar.xml` file.

**Superelements**

"mdb-resource-adapter" on page 77 (`sun-ejb-jar.xml`)

**Subelements**
The following table describes subelements for the `activation-config` element.

<table>
<thead>
<tr>
<th>TABLE A-2</th>
<th>activation-config subelements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Element</td>
<td>Required</td>
</tr>
<tr>
<td>&quot;description&quot; on page 52</td>
<td>zero or one</td>
</tr>
<tr>
<td>&quot;activation-config-property&quot; on page 33</td>
<td>one or more</td>
</tr>
</tbody>
</table>

**activation-config-property**

Specifies the name and value of an activation configuration property.

**Superelements**

"activation-config" on page 32 (`sun-ejb-jar.xml`)

**Subelements**
The following table describes subelements for the `activation-config-property` element.

<table>
<thead>
<tr>
<th>TABLE A-3</th>
<th>activation-config-property subelements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Element</td>
<td>Required</td>
</tr>
<tr>
<td>&quot;activation-config-property-name&quot; on page 33</td>
<td>only one</td>
</tr>
<tr>
<td>&quot;activation-config-property-value&quot; on page 34</td>
<td>only one</td>
</tr>
</tbody>
</table>

**activation-config-property-name**

Specifies the name of an activation configuration property.

**Superelements**

"activation-config-property" on page 33 (`sun-ejb-jar.xml`)
Subelements
none - contains data

activation-config-property-value
Specifies the value of an activation configuration property.

Superelements
“activation-config-property” on page 33 (sun-ejb-jar.xml)

Subelements
none - contains data

as-context
Specifies the authentication mechanism used to authenticate the client.

Superelements
“ior-security-config” on page 63 (sun-ejb-jar.xml)

Subelements
The following table describes subelements for the as-context element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“auth-method” on page 34</td>
<td>only one</td>
<td>Specifies the authentication method. The only supported value is USERNAME_PASSWORD.</td>
</tr>
<tr>
<td>“realm” on page 93</td>
<td>only one</td>
<td>Specifies the realm in which the user is authenticated.</td>
</tr>
<tr>
<td>“required” on page 96</td>
<td>only one</td>
<td>Specifies whether the authentication method specified in the auth-method element must be used for client authentication.</td>
</tr>
</tbody>
</table>

auth-method
Specifies the authentication method.

If the parent element is "as-context" on page 34, the only supported value is USERNAME_PASSWORD.
If the parent element is "login-config" on page 73, specifies the authentication mechanism for the web service endpoint. As a prerequisite to gaining access to any web resource protected by an authorization constraint, a user must be authenticated using the configured mechanism.

**Superelements**

"login-config" on page 73 (sun-web.xml), "as-context" on page 34 (sun-ejb-jar.xml)

**Subelements**

None - contains data

---

### bean-cache

Specifies the entity bean cache properties. Used for entity beans and stateful session beans.

**Superelements**

"ejb" on page 53 (sun-ejb-jar.xml)

**Subelements**

The following table describes subelements for the bean-cache element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;max-cache-size&quot; on page 75</td>
<td>zero or one</td>
<td>Specifies the maximum number of beans allowable in cache.</td>
</tr>
<tr>
<td>&quot;is-cache-overflow-allowed&quot; on page 63</td>
<td>zero or one</td>
<td>Deprecated.</td>
</tr>
<tr>
<td>&quot;cache-idle-timeout-in-seconds&quot; on page 40</td>
<td>zero or one</td>
<td>Specifies the maximum time that a stateful session bean or entity bean is allowed to be idle in cache before being passivated. Default value is 10 minutes (600 seconds).</td>
</tr>
<tr>
<td>&quot;removal-timeout-in-seconds&quot; on page 94</td>
<td>zero or one</td>
<td>Specifies the amount of time a bean remains before being removed. If removal-timeout-in-seconds is less than idle-timeout, the bean is removed without being passivated.</td>
</tr>
<tr>
<td>&quot;resize-quantity&quot; on page 97</td>
<td>zero or one</td>
<td>Specifies the number of beans to be created if the pool is empty (subject to the max-pool-size limit). Values are from 0 to MAX_INTEGER.</td>
</tr>
</tbody>
</table>
### Table A–5  bean-cache Subelements (Continued)

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;victim-selection-policy&quot; on page 118</td>
<td>zero or one</td>
<td>Specifies the algorithm that must be used by the container to pick victims. Applies only to stateful session beans.</td>
</tr>
</tbody>
</table>

### Example

```xml
<bean-cache>
  <max-cache-size>100</max-cache-size>
  <cache-resize-quantity>10</cache-resize-quantity>
  <removal-timeout-in-seconds>3600</removal-timeout-in-seconds>
  <victim-selection-policy>LRU</victim-selection-policy>
    <cache-idle-timeout-in-seconds>600</cache-idle-timeout-in-seconds>
    <removal-timeout-in-seconds>5400</removal-timeout-in-seconds>
  </bean-cache>
```

### bean-pool

Specifies the pool properties of stateless session beans, entity beans, and message-driven bean.

#### Superelements

"ejb" on page 53 (sun-ejb-jar.xml)

#### Subelements

The following table describes subelements for the bean-pool element.

### Table A–6  bean-pool Subelements

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;steady-pool-size&quot; on page 108</td>
<td>zero or one</td>
<td>Specifies the initial and minimum number of beans maintained in the pool. Default is 32.</td>
</tr>
<tr>
<td>&quot;resize-quantity&quot; on page 97</td>
<td>zero or one</td>
<td>Specifies the number of beans to be created if the pool is empty (subject to the max-pool-size limit). Values are from 0 to MAX_INTEGER.</td>
</tr>
<tr>
<td>&quot;max-pool-size&quot; on page 76</td>
<td>zero or one</td>
<td>Specifies the maximum number of beans in the pool. Values are from 0 to MAX_INTEGER. Default is to the EJB container value or 60.</td>
</tr>
<tr>
<td>&quot;max-wait-time-in-millis&quot; on page 76</td>
<td>zero or one</td>
<td>Deprecated.</td>
</tr>
</tbody>
</table>

---

GlassFish v3 Application Server Application Deployment Guide • May 2008
TABLE A–6 bean-pool Subelements (Continued)

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;pool-idle-timeout-in-seconds&quot; on page 87</td>
<td>zero or one</td>
<td>Specifies the maximum time that a bean is allowed to be idle in the pool. After this time, the bean is removed. This is a hint to the server. Default time is 600 seconds (10 minutes).</td>
</tr>
</tbody>
</table>

Example

```xml
<bean-pool>
  <steady-pool-size>10</steady-pool-size>
  <resize-quantity>10</resize-quantity>
  <max-pool-size>100</max-pool-size>
  <pool-idle-timeout-in-seconds>600</pool-idle-timeout-in-seconds>
</bean-pool>
```

C

**cache**

Configures caching for web application components.

**Superelements**

"sun-web-app" on page 111 (sun-web.xml)

**Subelements**

The following table describes subelements for the cache element.

TABLE A–7 cache Subelements

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;cache-helper&quot; on page 39</td>
<td>zero or more</td>
<td>Specifies a custom class that implements the CacheHelper interface.</td>
</tr>
<tr>
<td>&quot;default-helper&quot; on page 50</td>
<td>zero or one</td>
<td>Allows you to change the properties of the default, built-in &quot;cache-helper&quot; on page 39 class.</td>
</tr>
<tr>
<td>&quot;property (with attributes)&quot; on page 90</td>
<td>zero or more</td>
<td>Specifies a cache property, which has a name and a value.</td>
</tr>
<tr>
<td>&quot;cache-mapping&quot; on page 40</td>
<td>zero or more</td>
<td>Maps a URL pattern or a servlet name to its cacheability constraints.</td>
</tr>
</tbody>
</table>

**Attributes**

The following table describes attributes for the cache element.
**Table A-8 cache Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max-entries</td>
<td>4096</td>
<td>(optional) Specifies the maximum number of entries the cache can contain. Must be a positive integer.</td>
</tr>
<tr>
<td>timeout-in-seconds</td>
<td>30</td>
<td>(optional) Specifies the maximum amount of time in seconds that an entry can remain in the cache after it is created or refreshed. Can be overridden by a &quot;timeout&quot; on page 115 element.</td>
</tr>
<tr>
<td>enabled</td>
<td>true</td>
<td>(optional) Determines whether servlet and JSP caching is enabled.</td>
</tr>
</tbody>
</table>

**Properties**

The following table describes properties for the cache element.

**Table A-9 cache Properties**

<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cacheClassName</td>
<td>com.sun.appserv.web.cache.LruCache</td>
<td>Specifies the fully qualified name of the class that implements the cache functionality. See &quot;Cache Class Names&quot; on page 38 for possible values.</td>
</tr>
<tr>
<td>MultiLRUSegmentSize</td>
<td>4096</td>
<td>Specifies the number of entries in a segment of the cache table that should have its own LRU (least recently used) list. Applicable only if cacheClassName is set to com.sun.appserv.web.cache.MultiLruCache.</td>
</tr>
<tr>
<td>MaxSize</td>
<td>unlimited; Long.MAX_VALUE</td>
<td>Specifies an upper bound on the cache memory size in bytes (KB or MB units). Example values are 32 KB or 2 MB. Applicable only if cacheClassName is set to com.sun.appserv.web.cache.BoundedMultiLruCache.</td>
</tr>
</tbody>
</table>

**Cache Class Names**

The following table lists possible values of the cacheClassName property.

**Table A-10 cacheClassName Values**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>com.sun.appserv.web.cache.LruCache</td>
<td>A bounded cache with an LRU (least recently used) cache replacement policy.</td>
</tr>
<tr>
<td>com.sun.appserv.web.cache.BaseCache</td>
<td>An unbounded cache suitable if the maximum number of entries is known.</td>
</tr>
</tbody>
</table>
### cache-helper

Specifies a class that implements the `com.sun.appserv.web.cache.CacheHelper` interface.

**Superelements**

- “cache” on page 37 (`sun-web.xml`)

**Subelements**

The following table describes subelements for the `cache-helper` element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“property(with attributes)” on page 90</td>
<td>zero or more</td>
<td>Specifies a property, which has a name and a value.</td>
</tr>
</tbody>
</table>

**Attributes**

The following table describes attributes for the `cache-helper` element.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>default</td>
<td>Specifies a unique name for the helper class, which is referenced in the “cache-mapping” on page 40 element.</td>
</tr>
<tr>
<td>class-name</td>
<td>none</td>
<td>Specifies the fully qualified class name of the cache helper, which must implement the <code>com.sun.appserv.web.CacheHelper</code> interface.</td>
</tr>
</tbody>
</table>

### cache-helper-ref

Specifies the name of the “cache-helper” on page 39 used by the parent “cache-mapping” on page 40 element.

**Superelements**

- “cache-mapping” on page 40 (`sun-web.xml`)
Subelements
none - contains data

**cache-idle-timeout-in-seconds**

Specifies the maximum time that a bean can remain idle in the cache. After this amount of time, the container can passivate this bean. A value of 0 specifies that beans never become candidates for passivation. Default is 600.

Applies to stateful session beans and entity beans.

**Superelements**
*“bean-cache” on page 35 (sun-ejb-jar.xml)*

**Subelements**
none - contains data

**cache-mapping**

Maps a URL pattern or a servlet name to its cacheability constraints.

**Superelements**
*“cache” on page 37 (sun-web.xml)*

**Subelements**
The following table describes subelements for the cache-mapping element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“servlet-name” on page 106</td>
<td>requires one servlet-name or url-pattern</td>
<td>Contains the name of a servlet.</td>
</tr>
<tr>
<td>“url-pattern” on page 117</td>
<td>requires one servlet-name or url-pattern</td>
<td>Contains a servlet URL pattern for which caching is enabled.</td>
</tr>
<tr>
<td>“cache-helper-ref” on page 39</td>
<td>required if dispatcher, timeout, refresh-field, http-method, key-field, and constraint-field are not used</td>
<td>Contains the name of the “cache-helper” on page 39 used by the parent cache-mapping element.</td>
</tr>
</tbody>
</table>
### call-property

Specifies JAX-RPC property values that can be set on a `javax.xml.rpc.Call` object before it is returned to the web service client. The property names can be any properties supported by the JAX-RPC `Call` implementation.

### Superelements
- “port-info” on page 88, “service-ref” on page 104 (sun-web.xml, sun-ejb-jar.xml)

### Subelements

The following table describes subelements for the `call-property` element.

**TABLE A–14 call-property subelements**

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“name” on page 83</td>
<td>only one</td>
<td>Specifies the name of the entity.</td>
</tr>
<tr>
<td>“value” on page 118</td>
<td>only one</td>
<td>Specifies the value of the entity.</td>
</tr>
</tbody>
</table>

### caller-propagation

Specifies whether the target accepts propagated caller identities. The values are NONE, SUPPORTED, or REQUIRED.
Superelements
“sas-context” on page 100 (sun-ejb-jar.xml)

Subelements
none - contains data

**checkpoint-at-end-of-method**

Specifies that the stateful session bean state is checkpointed, or persisted, after the specified methods are executed. The availability-enabled attribute of the parent “ejb” on page 53 element must be set to true.

Superelements
“ejb” on page 53 (sun-ejb-jar.xml)

Subelements
The following table describes subelements for the checkpoint-at-end-of-method element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“method” on page 81</td>
<td>one or more</td>
<td>Specifies a bean method.</td>
</tr>
</tbody>
</table>

**checkpointed-methods**

Superelements
“ejb” on page 53 (sun-ejb-jar.xml)

**class-loader**

Configures the class loader for the web module.

Superelements
“sun-web-app” on page 111 (sun-web.xml)
Subelements

The following table describes subelements for the `class-loader` element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;property(with attributes)&quot; on page 90</td>
<td>zero or more</td>
<td>Specifies a property, which has a name and a value.</td>
</tr>
</tbody>
</table>

Attributes

The following table describes attributes for the `class-loader` element.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>extra-class-path</td>
<td>null</td>
<td>(optional) Specifies a colon or semicolon separated list of additional classpaths for this web module. Paths can be absolute or relative to the web module’s root, for example: <code>extra-class-path=WEB-INF/lib/extra(extra.jar)</code></td>
</tr>
<tr>
<td>delegate</td>
<td>true</td>
<td>(optional) If true, the web module follows the standard class loader delegation model and delegates to its parent class loader first before looking in the local class loader. You must set this to true for a web application that accesses EJB components or that acts as a web service client or endpoint. If false, the web module follows the delegation model specified in the Servlet specification and looks in its class loader before looking in the parent class loader. It’s safe to set this to false only for a web module that does not interact with any other modules. <strong>Note</strong> – For Technology Preview 2, the delegate value is ignored and assumed to be set to true.</td>
</tr>
<tr>
<td>dynamic-reload-interval</td>
<td></td>
<td>(optional) Not implemented. Included for backward compatibility with previous GlassFish Web Server versions.</td>
</tr>
</tbody>
</table>

Note – If the delegate element is set to false, the class loader delegation behavior complies with the Servlet 2.4 specification, section 9.7.2. If set to its default value of true, classes and resources residing in container-wide library JAR files are loaded in preference to classes and resources packaged within the WAR file.

Portable programs that use this element should not be packaged with any classes or interfaces that are a part of the Java EE specification. The behavior of a program that includes such classes or interfaces in its WAR file is undefined.
Properties

The following table describes properties for the class-loader element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ignoreHiddenJarFiles</td>
<td>false</td>
<td>If true, specifies that all JAR and ZIP files in the WEB-INF/lib directory that start with a period (.) are ignored by the class loader.</td>
</tr>
</tbody>
</table>

**cmp**

Describes runtime information for a CMP entity bean object for EJB 1.1 and EJB 2.1 beans.

**Superelements**

“ejb” on page 53 (sun-ejb-jar.xml)

**Subelements**

The following table describes subelements for the cmp element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“mapping-properties” on page 75</td>
<td>zero or one</td>
<td>This element is not implemented.</td>
</tr>
<tr>
<td>“is-one-one-cmp” on page 64</td>
<td>zero or one</td>
<td>This element is not implemented.</td>
</tr>
<tr>
<td>“one-one-finders” on page 84</td>
<td>zero or one</td>
<td>Describes the finders for CMP 1.1 beans.</td>
</tr>
<tr>
<td>“prefetch-disabled” on page 88</td>
<td>zero or one</td>
<td>Disables prefetching of entity bean states for the specified query methods.</td>
</tr>
</tbody>
</table>

**cmp-resource**

Specifies the database to be used for storing CMP beans.

**Superelements**

“enterprise-beans” on page 58 (sun-ejb-jar.xml)

**Subelements**

The following table describes subelements for the cmp-resource element.
TABLE A-20 cmp-resource Subelements

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;jndi-name&quot; on page 65</td>
<td>only one</td>
<td>Specifies the absolute jndi-name of a JDBC resource.</td>
</tr>
<tr>
<td>&quot;default-resource-principal&quot; on page 51</td>
<td>zero or one</td>
<td>Specifies the default runtime bindings of a resource reference.</td>
</tr>
<tr>
<td>&quot;property (with subelements)&quot; on page 91</td>
<td>zero or more</td>
<td>Specifies a property name and value. Used to configure PersistenceManagerFactory properties.</td>
</tr>
<tr>
<td>&quot;create-tables-at-deploy&quot; on page 49</td>
<td>zero or one</td>
<td>If true, specifies that database tables are created for beans that are automatically mapped by the EJB container.</td>
</tr>
<tr>
<td>&quot;drop-tables-at-undeploy&quot; on page 52</td>
<td>zero or one</td>
<td>If true, specifies that database tables that were automatically created when the bean(s) were last deployed are dropped when the bean(s) are undeployed.</td>
</tr>
<tr>
<td>&quot;database-vendor-name&quot; on page 50</td>
<td>zero or one</td>
<td>Specifies the name of the database vendor for which tables can be created.</td>
</tr>
<tr>
<td>&quot;schema-generator-properties&quot; on page 101</td>
<td>zero or one</td>
<td>Specifies field-specific type mappings and allows you to set the use-unique-table-names property.</td>
</tr>
</tbody>
</table>

**cmt-timeout-in-seconds**

Overrides the Transaction Timeout setting of the Transaction Service for an individual bean. The default value, 0, specifies that the default Transaction Service timeout is used. If positive, this value is used for all methods in the bean that start a new container-managed transaction. This value is not used if the bean joins a client transaction.

**Superelements**

"ejb" on page 53 (sun-ejb-jar.xml)

**Subelements**

none - contains data

**commit-option**

Specifies the commit option used on transaction completion. Valid values for the Application Server are B or C. Default value is B. Applies to entity beans.

**Note** – Commit option A is not supported for this Application Server release.
**Superelements**

“ejb” on page 53 (sun-ejb-jar.xml)

**Subelements**

none - contains data

---

**confidentiality**

Specifies if the target supports privacy-protected messages. The values are NONE, SUPPORTED, or REQUIRED.

**Superelements**

“transport-config” on page 116 (sun-ejb-jar.xml)

**Subelements**

none - contains data

---

**constraint-field**

Specifies a cacheability constraint for the given “url-pattern” on page 117 or “servlet-name” on page 106.

All constraint-field constraints must pass for a response to be cached. If there are value constraints, at least one of them must pass.

**Superelements**

“cache-mapping” on page 40 (sun-web.xml)

**Subelements**

The following table describes subelements for the constraint-field element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“constraint-field-value” on page 47</td>
<td>zero or more</td>
<td>Contains a value to be matched to the input parameter value.</td>
</tr>
</tbody>
</table>

---

**Attributes**

The following table describes attributes for the constraint-field element.
constraint-field

Specifies a value to be matched to the input parameter value. The matching is case sensitive. For example:

```xml
<value match-expr="in-range">1-60</value>
```

Superelements

"constraint-field" on page 46 (sun-web.xml)

Subelements

none - contains data

Attributes

The following table describes attributes for the constraint-field-value element.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>none</td>
<td>Specifies the input parameter name.</td>
</tr>
<tr>
<td>scope</td>
<td>request.parameter</td>
<td>(optional) Specifies the scope from which the input parameter is retrieved. Allowed values are context.attribute, request.header, request.parameter, request.cookie, request.attribute, and session.attribute.</td>
</tr>
<tr>
<td>cache-on-match</td>
<td>true</td>
<td>(optional) If true, caches the response if matching succeeds. Overrides the same attribute in a &quot;constraint-field-value&quot; on page 47 subelement.</td>
</tr>
<tr>
<td>cache-on-match-failure</td>
<td>false</td>
<td>(optional) If true, caches the response if matching fails. Overrides the same attribute in a &quot;constraint-field-value&quot; on page 47 subelement.</td>
</tr>
<tr>
<td>match-expr</td>
<td>equals</td>
<td>(optional) Specifies the type of comparison performed with the value. Allowed values are equals, not-equals, greater, lesser, and in-range.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If match-expr is greater or lesser, the value must be a number. If match-expr is in-range, the value must be of the form n1-n2, where n1 and n2 are numbers.</td>
</tr>
<tr>
<td>cache-on-match</td>
<td>true</td>
<td>(optional) If true, caches the response if matching succeeds.</td>
</tr>
</tbody>
</table>

TABLE A–23  constraint-field-value Attributes
context-root

Contains the web context root for the web application. Overrides the corresponding element in the web.xml file.

Superelements

“sun-web-app” on page 111 (sun-web.xml)

Subelements

none - contains data

cookie-properties

Specifies session cookie properties.

Superelements

“session-config” on page 106 (sun-web.xml)

Subelements

The following table describes subelements for the cookie-properties element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“property (with attributes)” on page 90</td>
<td>zero or more</td>
<td>Specifies a property, which has a name and a value.</td>
</tr>
</tbody>
</table>

Properties

The following table describes properties for the cookie-properties element.
### TABLE A-25  cookie-properties Properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cookiePath</td>
<td>Context path at which the web module is installed.</td>
<td>Specifies the pathname that is set when the cookie is created. The browser sends the cookie if the pathname for the request contains this path. If set to / (slash), the browser sends cookies to all URLs served by the Application Server. You can set the path to a narrower mapping to limit the request URLs to which the browser sends cookies.</td>
</tr>
<tr>
<td>cookieMaxAgeSeconds</td>
<td>-1</td>
<td>Specifies the expiration time (in seconds) after which the browser expires the cookie.</td>
</tr>
<tr>
<td>cookieDomain</td>
<td>(unset)</td>
<td>Specifies the domain for which the cookie is valid.</td>
</tr>
<tr>
<td>cookieComment</td>
<td>GlassFish Application Server Session Tracking Cookie</td>
<td>Specifies the comment that identifies the session tracking cookie in the cookie file. Applications can provide a more specific comment for the cookie.</td>
</tr>
<tr>
<td>cookieSecure</td>
<td>dynamic</td>
<td>Sets the Secure attribute of any JSESSION or JSESSIONIDSSO cookies associated with the web application. Allowed values are as follows:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- true — Sets Secure to true.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- false — Sets Secure to false.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- dynamic — Sets Secure to the security setting of the request that generated the cookie.</td>
</tr>
</tbody>
</table>

### create-tables-at-deploy

Specifies whether database tables are created for beans that are automatically mapped by the EJB container. If true, creates tables in the database. If false (the default if this element is not present), does not create tables.

This element can be overridden during deployment. See GlassFish v3 Application Server Developer's Guide.

### Superelements

“cmp-resource” on page 44 (sun-ejb-jar.xml)

### Subelements

none - contains data
database-vendor-name

Specifies the name of the database vendor for which tables can be created. Allowed values are javadb, db2, mssql, oracle, postgresql, pointbase, derby (also for CloudScape), and sybase, case-insensitive.

If no value is specified, a connection is made to the resource specified by the “jndi-name” on page 65 subelement of the “cmp-resource” on page 44 element, and the database vendor name is read. If the connection cannot be established, or if the value is not recognized, SQL-92 compliance is presumed.

This element can be overridden during deployment. See GlassFish v3 Application Server Developer’s Guide.

Superelements
“cmp-resource” on page 44 (sun-ejb-jar.xml)

Subelements
none - contains data

debugging-enabled

Specifies whether the debugging servlet is enabled for this web service endpoint. Allowed values are true (the default) and false.

Superelements
“webservice-endpoint” on page 120 (sun-web.xml, sun-ejb-jar.xml)

Subelements
none - contains data

default-helper

Passes property values to the built-in default “cache-helper” on page 39 class.

Superelements
“cache” on page 37 (sun-web.xml)
Subelements

The following table describes subelements for the `default-helper` element.

**TABLE A–26  default-helper Subelements**

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;property (with attributes)&quot; on page 90</td>
<td>zero or more</td>
<td>Specifies a property, which has a name and a value.</td>
</tr>
</tbody>
</table>

Properties

The following table describes properties for the `default-helper` element.

**TABLE A–27  default-helper Properties**

<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cacheKeyGeneratorAttrName</td>
<td>Uses the built-in default &quot;cache-helper&quot; on page 39 key generation, which concatenates the servlet path with &quot;key-field&quot; on page 69 values, if any.</td>
<td>The caching engine looks in the ServletContext for an attribute with a name equal to the value specified for this property to determine whether a customized CacheKeyGenerator implementation is used. An application can provide a customized key generator rather than using the default helper. See “The CacheKeyGenerator Interface” in GlassFish v3 Application Server Developer’s Guide.</td>
</tr>
</tbody>
</table>

**default-resource-principal**

Specifies the default principal (user) for the resource.

Superelements

"resource-ref" on page 99 (`sun-web.xml`, `sun-ejb-jar.xml`); “cmp-resource” on page 44, “mdb-connection-factory” on page 76 (`sun-ejb-jar.xml`)

Subelements

The following table describes subelements for the `default-resource-principal` element.

**TABLE A–28  default-resource-principal Subelements**

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;name&quot; on page 83</td>
<td>only one</td>
<td>Specifies the default resource principal name used to sign on to a resource manager.</td>
</tr>
<tr>
<td>&quot;password&quot; on page 86</td>
<td>only one</td>
<td>Specifies password of the default resource principal.</td>
</tr>
</tbody>
</table>
description

Specifies a text description of the containing element.

Superelements

“property (with attributes)” on page 90 (sun-web.xml); “activation-config” on page 32, “method” on page 81 (sun-ejb-jar.xml)

Subelements

none - contains data

dispatcher

Specifies a comma-separated list of RequestDispatcher methods for which caching is enabled on the target resource. Valid values are REQUEST, FORWARD, INCLUDE, and ERROR. If this element is not specified, the default is REQUEST. See SRV.6.2.5 of the Servlet 2.4 specification for more information.

Superelements

“cache-mapping” on page 40 (sun-web.xml)

Subelements

none - contains data

drop-tables-at-undeploy

Specifies whether database tables that were automatically created when the bean(s) were last deployed are dropped when the bean(s) are undeployed. If true, drops tables from the database. If false (the default if this element is not present), does not drop tables.

This element can be overridden during deployment. See GlassFish v3 Application Server Developer's Guide.

Superelements

“cmp-resource” on page 44 (sun-ejb-jar.xml)

Subelements

none - contains data
**ejb**

Defines runtime properties for a single enterprise bean within the application. The subelements listed below apply to particular enterprise beans as follows:

- All types of beans: `ejb-name`, `ejb-ref`, `resource-ref`, `resource-env-ref`, `ior-security-config`, `gen-classes`, `jndi-name`, `use-thread-pool-id`, `message-destination-ref`, `pass-by-reference`, `service-ref`
- Stateless session beans: `bean-pool`, `webservice-endpoint`
- Stateful session beans: `bean-cache`, `webservice-endpoint`, `checkpoint-at-end-of-method`
- Entity beans: `commit-option`, `bean-cache`, `bean-pool`, `cmp`, `is-read-only-bean`, `refresh-period-in-seconds`, `flush-at-end-of-method`
- Message-driven beans: `mdb-resource-adapter`, `mdb-connection-factory`, `jms-durable-subscription-name`, `jms-max-messages-load`, `bean-pool`

**Superelements**

"enterprise-beans" on page 58 (sun-ejb-jar.xml)

**Subelements**

The following table describes subelements for the `ejb` element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;ejb-name&quot; on page 56</td>
<td>only one</td>
<td>Matches the <code>ejb-name</code> in the corresponding sun-ejb-jar.xml file.</td>
</tr>
<tr>
<td>&quot;jndi-name&quot; on page 65</td>
<td>zero or more</td>
<td>Specifies the absolute <code>jndi-name</code>.</td>
</tr>
<tr>
<td>&quot;ejb-ref&quot; on page 56</td>
<td>zero or more</td>
<td>Maps the absolute JNDI name to the <code>ejb-ref</code> element in the corresponding Java EE XML file.</td>
</tr>
<tr>
<td>&quot;resource-ref&quot; on page 99</td>
<td>zero or more</td>
<td>Maps the absolute JNDI name to the <code>resource-ref</code> in the corresponding Java EE XML file.</td>
</tr>
<tr>
<td>&quot;resource-env-ref&quot; on page 98</td>
<td>zero or more</td>
<td>Maps the absolute JNDI name to the <code>resource-env-ref</code> in the corresponding Java EE XML file.</td>
</tr>
<tr>
<td>&quot;service-ref&quot; on page 104</td>
<td>zero or more</td>
<td>Specifies runtime settings for a web service reference.</td>
</tr>
<tr>
<td><strong>Element</strong></td>
<td><strong>Required</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>-------------</td>
<td>-------------</td>
<td>-----------------</td>
</tr>
<tr>
<td>&quot;message-destination-ref&quot; on page 79</td>
<td>zero or more</td>
<td>Specifies the name of a physical message destination.</td>
</tr>
<tr>
<td>&quot;pass-by-reference&quot; on page 85</td>
<td>zero or one</td>
<td>Specifies the passing method used by an enterprise bean calling a remote interface method in another bean that is colocated within the same process.</td>
</tr>
<tr>
<td>&quot;cmp&quot; on page 44</td>
<td>zero or one</td>
<td>Specifies runtime information for a container-managed persistence (CMP) entity bean for EJB 1.1 and EJB 2.1 beans.</td>
</tr>
<tr>
<td>&quot;principal&quot; on page 89</td>
<td>zero or one</td>
<td>Specifies the principal (user) name in an enterprise bean that has the run-as role specified.</td>
</tr>
<tr>
<td>&quot;mdb-connection-factory&quot; on page 76</td>
<td>zero or one</td>
<td>Specifies the connection factory associated with a message-driven bean.</td>
</tr>
<tr>
<td>&quot;jms-durable-subscription-name&quot; on page 65</td>
<td>zero or one</td>
<td>Specifies the durable subscription associated with a message-driven bean.</td>
</tr>
<tr>
<td>&quot;jms-max-messages-load&quot; on page 65</td>
<td>zero or one</td>
<td>Specifies the maximum number of messages to load into a Java Message Service session at one time for a message-driven bean to serve. The default is 1.</td>
</tr>
<tr>
<td>&quot;ior-security-config&quot; on page 63</td>
<td>zero or one</td>
<td>Specifies the security information for the IOR.</td>
</tr>
<tr>
<td>&quot;is-read-only-bean&quot; on page 64</td>
<td>zero or one</td>
<td>Specifies that this entity bean is read-only.</td>
</tr>
<tr>
<td>&quot;refresh-period-in-seconds&quot; on page 94</td>
<td>zero or one</td>
<td>Specifies the rate at which a read-only-bean must be refreshed from the data source.</td>
</tr>
<tr>
<td>&quot;commit-option&quot; on page 45</td>
<td>zero or one</td>
<td>Has valid values of B or C. Default value is B.</td>
</tr>
<tr>
<td>&quot;commit-timeout-in-seconds&quot; on page 45</td>
<td>zero or one</td>
<td>Overrides the Transaction Timeout setting of the Transaction Service for an individual bean.</td>
</tr>
<tr>
<td>&quot;use-thread-pool-id&quot; on page 118</td>
<td>zero or one</td>
<td>Specifies the thread pool from which threads are selected for remote invocations of this bean.</td>
</tr>
<tr>
<td>&quot;gen-classes&quot; on page 61</td>
<td>zero or one</td>
<td>Specifies all the generated class names for a bean.</td>
</tr>
<tr>
<td>&quot;bean-pool&quot; on page 36</td>
<td>zero or one</td>
<td>Specifies the bean pool properties. Used for stateless session beans, entity beans, and message-driven beans.</td>
</tr>
<tr>
<td>&quot;bean-cache&quot; on page 35</td>
<td>zero or one</td>
<td>Specifies the bean cache properties. Used only for stateful session beans and entity beans.</td>
</tr>
<tr>
<td>&quot;mdb-resource-adapter&quot; on page 77</td>
<td>zero or one</td>
<td>Specifies runtime configuration information for a message-driven bean.</td>
</tr>
<tr>
<td>&quot;webservice-endpoint&quot; on page 120</td>
<td>zero or more</td>
<td>Specifies information about a web service endpoint.</td>
</tr>
<tr>
<td>&quot;flush-at-end-of-method&quot; on page 60</td>
<td>zero or one</td>
<td>Specifies the methods that force a database flush after execution. Used for entity beans.</td>
</tr>
</tbody>
</table>
Table A–29  ejb Subelements  (Continued)

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;checkpointed-methods&quot; on page 42</td>
<td>zero or one</td>
<td>Deprecated. Supported for backward compatibility. Use &quot;checkpoint-at-end-of-method&quot; on page 42 instead.</td>
</tr>
<tr>
<td>&quot;checkpoint-at-end-of-method&quot; on page 42</td>
<td>zero or one</td>
<td>Specifies that the stateful session bean state is checkpointed, or persisted, after the specified methods are executed. The availability-enabled attribute must be set to true.</td>
</tr>
</tbody>
</table>

### Attributes

The following table describes attributes for the ejb element.

Table A–30  ejb Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>availability-enabled</td>
<td>false</td>
<td>(optional) If set to true, and if availability is enabled in the EJB container, high-availability features apply to this bean if it is a stateful session bean.</td>
</tr>
</tbody>
</table>

### Example

```xml
<ejb>
    <ejb-name>CustomerEJB</ejb-name>
    <jndi-name>customer</jndi-name>
    <resource-ref>
        <res-ref-name>jdbc/SimpleBank</res-ref-name>
        <jndi-name>jdbc/__default</jndi-name>
    </resource-ref>
    <is-read-only-bean>false</is-read-only-bean>
    <commit-option>B</commit-option>
    <bean-pool>
        <steady-pool-size>10</steady-pool-size>
        <resize-quantity>10</resize-quantity>
        <max-pool-size>100</max-pool-size>
        <pool-idle-timeout-in-seconds>600</pool-idle-timeout-in-seconds>
    </bean-pool>
    <bean-cache>
        <max-cache-size>100</max-cache-size>
        <resize-quantity>10</resize-quantity>
        <removal-timeout-in-seconds>3600</removal-timeout-in-seconds>
        <victim-selection-policy>LRU</victim-selection-policy>
    </bean-cache>
</ejb>
```
**ejb-name**

In the `sun-ejb-jar.xml` file, matches the `ejb-name` in the corresponding `ejb-jar.xml` file. The name must be unique among the names of the enterprise beans in the same EJB JAR file.

There is no architected relationship between the `ejb-name` in the deployment descriptor and the JNDI name that the deployer assigns to the EJB component's home.

In the `sun-cmp-mappings.xml` file, specifies the `ejb-name` of the entity bean in the `ejb-jar.xml` file to which the container-managed persistence (CMP) bean corresponds.

**Superelements**

"ejb" on page 53, "method" on page 81 (sun-ejb-jar.xml)

**Subelements**

none - contains data

**ejb-ref**

Maps the `ejb-ref-name` in the corresponding Java EE deployment descriptor file `ejb-ref` entry to the absolute `jndi-name` of a resource.

The `ejb-ref` element is used for the declaration of a reference to an EJB's home. Applies to session beans or entity beans.

**Superelements**

"sun-web-app" on page 111 (sun-web.xml), "ejb" on page 53 (sun-ejb-jar.xml)

**Subelements**

The following table describes subelements for the `ejb-ref` element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;ejb-ref-name&quot; on 57</td>
<td>only one</td>
<td>Specifies the <code>ejb-ref-name</code> in the corresponding Java EE deployment descriptor file <code>ejb-ref</code> entry.</td>
</tr>
<tr>
<td>&quot;jndi-name&quot; on 65</td>
<td>only one</td>
<td>Specifies the absolute <code>jndi-name</code> of a resource.</td>
</tr>
</tbody>
</table>
ejb-ref-name

Specifies the ejb-ref-name in the corresponding Java EE deployment descriptor file ejb-ref entry.

Superelements
“ejb-ref” on page 56 (sun-web.xml, sun-ejb-jar.xml)

Subelements
none - contains data

endpoint-address-uri

Specifies the relative path combined with the web server root to form the fully qualified endpoint address for a web service endpoint. This is a required element for EJB endpoints and an optional element for servlet endpoints.

For servlet endpoints, this value is relative to the web application context root. For EJB endpoints, the URI is relative to root of the web server (the first portion of the URI is a context root). The context root portion must not conflict with the context root of any web application deployed to the same web server.

In all cases, this value must be a fixed pattern (no "*" allowed).

If the web service endpoint is a servlet that implements only a single endpoint and has only one url-pattern, it is not necessary to set this value, because the web container derives it from the web.xml file.

Superelements
“webservice-endpoint” on page 120 (sun-web.xml, sun-ejb-jar.xml)

Subelements
none - contains data

Example

If the web server is listening at http://localhost:8080, the following endpoint-address-uri:

<endpoint-address-uri>StockQuoteService/StockQuotePort</endpoint-address-uri>

results in the following target endpoint address:
http://localhost:8080/StockQuoteService/StockQuotePort

**enterprise-beans**

Specifies all the runtime properties for an EJB JAR file in the application.

**Superelements**

"sun-ejb-jar" on page 111 (sun-ejb-jar.xml)

**Subelements**

The following table describes subelements for the enterprise-beans element.

<table>
<thead>
<tr>
<th>TABLE A-32</th>
<th>enterprise-beans Subelements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Element</td>
<td>Required</td>
</tr>
<tr>
<td>&quot;name&quot; on page 83</td>
<td>zero or one</td>
</tr>
<tr>
<td>&quot;unique-id&quot; on page 117</td>
<td>zero or one</td>
</tr>
<tr>
<td>&quot;ejb&quot; on page 53</td>
<td>zero or more</td>
</tr>
<tr>
<td>&quot;pm-descriptors&quot; on page 87</td>
<td>zero or one</td>
</tr>
<tr>
<td>&quot;cmp-resource&quot; on page 44</td>
<td>zero or one</td>
</tr>
<tr>
<td>&quot;message-destination&quot; on page 78</td>
<td>zero or more</td>
</tr>
<tr>
<td>&quot;webservice-description&quot; on page 119</td>
<td>zero or more</td>
</tr>
</tbody>
</table>

**Example**

```
<enterprise-beans>
  <ejb>
    <ejb-name>CustomerEJB</ejb-name>
    <jndi-name>customer</jndi-name>
    <resource-ref>
      <res-ref-name>jdbc/SimpleBank</res-ref-name>
      <jndi-name>jdbc/__default</jndi-name>
    </resource-ref>
    <is-read-only-bean>false</is-read-only-bean>
    <commit-option>B</commit-option>
    <bean-pool>
```

GlassFish v3 Application Server Application Deployment Guide • May 2008
<steady-pool-size>10</steady-pool-size>
<resize-quantity>10</resize-quantity>
<max-pool-size>100</max-pool-size>
<pool-idle-timeout-in-seconds>600</pool-idle-timeout-in-seconds>
</bean-pool>
<bean-cache>
<max-cache-size>100</max-cache-size>
<resize-quantity>10</resize-quantity>
<removal-timeout-in-seconds>3600</removal-timeout-in-seconds>
<victim-selection-policy>LRU</victim-selection-policy>
</bean-cache>
</ejb>
</enterprise-beans>

establish-trust-in-client
Specifies if the target is capable of authenticating a client. The values are NONE, SUPPORTED, or REQUIRED.

Superelements
"transport-config" on page 116 (sun-ejb-jar.xml)

Subelements
none - contains data

establish-trust-in-target
Specifies if the target is capable of authenticating to a client. The values are NONE, SUPPORTED, or REQUIRED.

Superelements
"transport-config" on page 116 (sun-ejb-jar.xml)

Subelements
none - contains data
finder

Describes the finders for CMP 1.1 with a method name and query.

Superelements

“one-one-finders” on page 84 (sun-ejb-jar.xml)

Subelements

The following table describes subelements for the finder element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“method-name” on page 82</td>
<td>only one</td>
<td>Specifies the method name for the finder.</td>
</tr>
<tr>
<td>“query-params” on page 92</td>
<td>zero or one</td>
<td>Specifies the query parameters for the CMP 1.1 finder.</td>
</tr>
<tr>
<td>“query-filter” on page 91</td>
<td>zero or one</td>
<td>Specifies the query filter for the CMP 1.1 finder.</td>
</tr>
<tr>
<td>“query-variables” on page 93</td>
<td>zero or one</td>
<td>Specifies variables in query expression for the CMP 1.1 finder.</td>
</tr>
<tr>
<td>“query-ordering” on page 92</td>
<td>zero or one</td>
<td>Specifies the query ordering for the CMP 1.1 finder.</td>
</tr>
</tbody>
</table>

flush-at-end-of-method

Specifies the methods that force a database flush after execution. Applicable to entity beans.

Superelements

“ejb” on page 53 (sun-ejb-jar.xml)

Subelements

The following table describes subelements for the flush-at-end-of-method element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“method” on page 81</td>
<td>one or more</td>
<td>Specifies a bean method.</td>
</tr>
</tbody>
</table>
**gen-classes**

Specifies all the generated class names for a bean.

**Note** – This value is automatically generated by the server at deployment or redeployment time. Do not specify it or change it after deployment.

**Superelements**

"ejb" on page 53 (sun-ejb-jar.xml)

**Subelements**

The following table describes subelements for the gen-class element.

<table>
<thead>
<tr>
<th>Table A-35 gen-classes Subelements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Element</td>
</tr>
<tr>
<td>&quot;remote-impl&quot; on page 95</td>
</tr>
<tr>
<td>&quot;local-impl&quot; on page 70</td>
</tr>
<tr>
<td>&quot;remote-home-impl&quot; on page 95</td>
</tr>
<tr>
<td>&quot;local-home-impl&quot; on page 70</td>
</tr>
</tbody>
</table>

**group-name**

Specifies a group name in the current realm.

**Superelements**

"security-role-mapping" on page 102 (sun-web.xml, sun-ejb-jar.xml)

**Subelements**

none - contains data
http-method

Specifies an HTTP method that is eligible for caching. The default is GET.

Superelements

“cache-mapping” on page 40 (sun-web.xml)

Subelements

none - contains data

idempotent-url-pattern

Specifies a URL pattern for idempotent requests.

Superelements

“sun-web-app” on page 111 (sun-web.xml)

Subelements

none

Attributes

The following table describes attributes for the idempotent-url-pattern element.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url-pattern</td>
<td>none</td>
<td>Specifies a URL pattern, which can contain wildcards. The URL pattern must conform to the mappings specified in section SRV 11.2 of the Servlet 2.4 specification.</td>
</tr>
<tr>
<td>no-of-retries</td>
<td>-1</td>
<td>(optional) Specifies the number of times the load balancer retries an idempotent request. A value of -1 indicates infinite retries.</td>
</tr>
</tbody>
</table>
Example
The following example specifies that all requests for the URI sun-java/* are idempotent.

```xml
<idempotent-url-pattern url-pattern="sun_java/*" no-of-retries="10"/>
```

integrity
Specifies if the target supports integrity-protected messages. The values are NONE, SUPPORTED, or REQUIRED.

Superelements
"transport-config" on page 116 (sun-ejb-jar.xml)

Subelements
none - contains data

ior-security-config
Specifies the security information for the input-output redirection (IOR).

Superelements
"ejb" on page 53 (sun-ejb-jar.xml)

Subelements
The following table describes subelements for the ior-security-config element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;transport-config&quot; on page 116</td>
<td>zero or one</td>
<td>Specifies the security information for transport.</td>
</tr>
<tr>
<td>&quot;as-context&quot; on page 34</td>
<td>zero or one</td>
<td>Specifies the authentication mechanism used to authenticate the client. If specified, it is USERNAME_PASSWORD.</td>
</tr>
<tr>
<td>&quot;sas-context&quot; on page 100</td>
<td>zero or one</td>
<td>Describes the sas-context fields.</td>
</tr>
</tbody>
</table>

is-cache-overflow-allowed
This element is deprecated. Do not use.
Superelements
“bean-cache” on page 35 (sun-ejb-jar.xml)

is-one-one-cmp
This element is not used.

Superelements
“cmp” on page 44 (sun-ejb-jar.xml)

is-read-only-bean
Specifies that this entity bean is a read-only bean if true. If this element is absent, the default value of false is used.

Superelements
“ejb” on page 53 (sun-ejb-jar.xml)

Subelements
none - contains data

java-method
Specifies a method.

Superelements
“message” on page 77 (sun-web.xml, sun-ejb-jar.xml)

Subelements
The following table describes subelements for the java-method element.
### jms-durable-subscription-name

Specifies the durable subscription associated with a message-driven bean class. Only applies to the Java Message Service Topic Destination type, and only when the message-driven bean deployment descriptor subscription durability is Durable.

**Superelements**

“ejb” on page 53 (sun-ejb-jar.xml)

**Subelements**

none - contains data

### jms-max-messages-load

Specifies the maximum number of messages to load into a Java Message Service session at one time for a message-driven bean to serve. The default is 1.

**Superelements**

“ejb” on page 53 (sun-ejb-jar.xml)

**Subelements**

none - contains data

### jndi-name

Specifies the absolute jndi-name of a URL resource or a resource.

For entity beans and session beans, this value specifies the global JNDI name of the EJBHome object. It is only needed if the entity or session bean exposes a remote view.
Superelements

Subelements
none - contains data

jsp-config
Specifies JSP configuration information.

Superelements
"sun-web-app" on page 111 (sun-web.xml)

Subelements
The following table describes subelements for the jsp-config element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;property(with attributes)&quot; on page 90</td>
<td>zero or more</td>
<td>Specifies a property, which has a name and a value.</td>
</tr>
</tbody>
</table>

Properties
The default property values are tuned for development of JSP files at the cost of performance. To maximize performance, set jsp-config properties to these non-default values:

- development - false (as an alternative, set to true and give modificationTestInterval a large value)
- mappedfile - false
- trimSpaces - true
- suppressSmap - true
- fork - false (on Solaris)
- classdebuginfo - false

The following table describes properties for the jsp-config element.
<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>checkInterval</td>
<td>0</td>
<td>If development is set to false and checkInterval is greater than zero, background compilations are enabled. The checkInterval is the time in seconds between checks to see if a JSP file needs to be recompiled.</td>
</tr>
<tr>
<td>classDebugEnabled</td>
<td>true</td>
<td>Specifies whether the generated Java servlets are compiled with the debug option set (-g for javac).</td>
</tr>
<tr>
<td>classpath</td>
<td>created dynamically based on the current web application</td>
<td>Specifies the classpath to use when compiling generated servlets.</td>
</tr>
<tr>
<td>compiler</td>
<td>javac</td>
<td>Specifies the compiler Ant uses to compile JSP files. See the Ant documentation for more information: <a href="http://antinstaller.sourceforge.net/manual/manual/">http://antinstaller.sourceforge.net/manual/manual/</a></td>
</tr>
<tr>
<td>compilerSourceVM</td>
<td>Depends on the Application Server's Java runtime</td>
<td>Specifies the JDK release with which source compatibility of the generated servlets is provided. Same as the -source release option of javac. For more information, see <a href="http://java.sun.com/j2se/1.5.0/docs/tooldocs/solaris/javac.html#options">http://java.sun.com/j2se/1.5.0/docs/tooldocs/solaris/javac.html#options</a></td>
</tr>
<tr>
<td>compilerTargetVM</td>
<td>Depends on the Application Server's Java runtime</td>
<td>Specifies the JVM version for which the servlet class files are generated. Same as the -target release option of javac. For more information, see <a href="http://java.sun.com/j2se/1.5.0/docs/tooldocs/solaris/javac.html#options">http://java.sun.com/j2se/1.5.0/docs/tooldocs/solaris/javac.html#options</a></td>
</tr>
<tr>
<td>defaultBufferSize</td>
<td>false</td>
<td>If true, the default for the buffer attribute of the page directive is none.</td>
</tr>
<tr>
<td>development</td>
<td>true</td>
<td>If set to true, enables development mode, which allows JSP files to be checked for modification. Specify the frequency at which JSPs are checked using the modificationTestInterval property.</td>
</tr>
<tr>
<td>dumpSmap</td>
<td>false</td>
<td>If set to true, dumps SMAP information for JSR 45 debugging to a file. Set to false if suppressSmap is true.</td>
</tr>
<tr>
<td>enablePooling</td>
<td>true</td>
<td>If set to true, tag handler pooling is enabled.</td>
</tr>
<tr>
<td>enableTldValidation</td>
<td>false</td>
<td>If set to true, all Tag Library Descriptor (TLD) files referenced by the web application are validated against their underlying schema or DTD file.</td>
</tr>
<tr>
<td>errorOnUseBeanInvalidClassAttribute</td>
<td>false</td>
<td>If set to true, issues an error when the value of the class attribute in a useBean action is not a valid bean class.</td>
</tr>
<tr>
<td>fork</td>
<td>true</td>
<td>Specifies that Ant forks the compiling of JSP files, using a JVM separate from the one in which Tomcat is running.</td>
</tr>
</tbody>
</table>
### Properties (Continued)

<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>genStrAsByteArray</td>
<td>true</td>
<td>If true, text strings are generated as bytes (encoded with the page encoding), if the page is not buffered.</td>
</tr>
<tr>
<td>genStrAsCharArray</td>
<td>false</td>
<td>If set to true, generates text strings as char arrays, which improves performance in some cases.</td>
</tr>
<tr>
<td>httpMethods</td>
<td>* for all methods</td>
<td>Specifies a comma separated list of HTTP methods supported by the JspServlet.</td>
</tr>
<tr>
<td>ieClassId</td>
<td>clsid:8AD9C840-044E-11D1-B3E9-00805F499093</td>
<td>Specifies the Java plug-in COM class ID for Internet Explorer. Used by the <code>&lt;jsp:plugin&gt;</code> tags.</td>
</tr>
<tr>
<td>ignoreJspFragmentErrors</td>
<td>false</td>
<td>If set to true, instructs the compiler to ignore any JSP precompilation errors pertaining to statically included JSP segments that, despite not being top level JSP files, use the <code>.jsp</code> or <code>.jspx</code> extension (instead of the recommended <code>.jspf</code>).</td>
</tr>
<tr>
<td>initialCapacity</td>
<td>32</td>
<td>Specifies the initial capacity of the HashMap that maps JSP files to their corresponding servlets.</td>
</tr>
<tr>
<td>javaEncoding</td>
<td>UTF8</td>
<td>Specifies the encoding for the generated Java servlet. This encoding is passed to the Java compiler that is used to compile the servlet as well. By default, the web container tries to use UTF8. If that fails, it tries to use the <code>javaEncoding</code> value. For encodings, see: <a href="http://java.sun.com/j2se/1.5.0/docs/guide/intl/encoding.doc.html">http://java.sun.com/j2se/1.5.0/docs/guide/intl/encoding.doc.html</a></td>
</tr>
<tr>
<td>keepgenerated</td>
<td>true with JDK 5 and before and for jspc, otherwise false</td>
<td>If set to true, keeps the generated Java files. If false, deletes the Java files.</td>
</tr>
<tr>
<td>mappedfile</td>
<td>true</td>
<td>If set to true, generates static content with one print statement per input line, to ease debugging.</td>
</tr>
<tr>
<td>modification</td>
<td>0</td>
<td>Specifies the frequency in seconds at which JSPs are checked for modification. A value of 0 causes the JSP to be checked on every access. Used only if development is set to true.</td>
</tr>
<tr>
<td>scratchdir</td>
<td>The default work directory for the web application</td>
<td>Specifies the working directory created for storing all the generated code.</td>
</tr>
</tbody>
</table>

### jsp-config Properties (Continued)

<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>suppressSmap</td>
<td>false</td>
<td>If set to true, generation of SMAP information for JSR 45 debugging is suppressed.</td>
</tr>
<tr>
<td>trimSpaces</td>
<td>false</td>
<td>If set to true, trims white spaces in template text between actions or directives.</td>
</tr>
<tr>
<td>usePrecompiled</td>
<td>false</td>
<td>If set to true, an accessed JSP file is not compiled. Its precompiled servlet class is used instead. If it is assumed that JSP files have been precompiled, and their corresponding servlet classes have been bundled in the web application's WEB-INF/lib or WEB-INF/classes directory.</td>
</tr>
<tr>
<td>xpoweredBy</td>
<td>true</td>
<td>If set to true, the X-Powered-By response header is added by the generated servlet.</td>
</tr>
</tbody>
</table>

#### key-field

Specifies a component of the key used to look up and extract cache entries. The web container looks for the named parameter, or field, in the specified scope.

If this element is not present, the web container uses the Servlet Path (the path section that corresponds to the servlet mapping that activated the current request). See the Servlet 2.4 specification, section SRV 4.4, for details on the Servlet Path.

#### Superelements

"cache-mapping" on page 40 (sun-web.xml)

#### Subelements

none

#### Attributes

The following table describes attributes for the key-field element.
### TABLE A–41 key-field Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>none</td>
<td>Specifies the input parameter name.</td>
</tr>
<tr>
<td>scope</td>
<td>request.parameter</td>
<td>(optional) Specifies the scope from which the input parameter is retrieved. Allowed values are context.attribute, request.header, request.parameter, request.cookie, session.id, and session.attribute.</td>
</tr>
</tbody>
</table>

---

**local-home-impl**

Specifies the fully-qualified class name of the generated EJBLocalHome impl class.

**Note** – This value is automatically generated by the server at deployment or redeployment time. Do not specify it or change it after deployment.

**Superelements**

“gen-classes” on page 61 (sun-ejb-jar.xml)

**Subelements**

none - contains data

---

**local-impl**

Specifies the fully-qualified class name of the generated EJBLocalObject impl class.

**Note** – This value is automatically generated by the server at deployment or redeployment time. Do not specify it or change it after deployment.

**Superelements**

“gen-classes” on page 61 (sun-ejb-jar.xml)

**Subelements**

none - contains data
locale-charset-info

Deprecated. For backward compatibility only. Use the "parameter-encoding" on page 84 subelement of "sun-web-app" on page 111 instead. Specifies information about the application’s internationalization settings.

Superelements

"sun-web-app" on page 111 (sun-web.xml)

Subelements

The following table describes subelements for the locale-charset-info element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;locale-charset-map&quot; on page 71</td>
<td>one or more</td>
<td>Maps a locale and an agent to a character encoding. Provided for backward compatibility. Used only for request processing, and only if no parameter-encoding is defined.</td>
</tr>
<tr>
<td>&quot;parameter-encoding&quot; on page 84</td>
<td>zero or one</td>
<td>Determines the default request character encoding and how the web container decodes parameters from forms according to a hidden field value.</td>
</tr>
</tbody>
</table>

Attributes

The following table describes attributes for the locale-charset-info element.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default-locale</td>
<td>none</td>
<td>Although a value is required, the value is ignored. Use the default-charset attribute of the &quot;parameter-encoding&quot; on page 84 element.</td>
</tr>
</tbody>
</table>

locale-charset-map

Maps locales and agents to character encodings. Provided for backward compatibility. Used only for request processing. Used only if the character encoding is not specified in the request and cannot be derived from the optional "parameter-encoding" on page 84 element. For encodings, see http://java.sun.com/j2se/1.5.0/docs/guide/intl/encoding.doc.html.

Superelements

"locale-charset-info" on page 71 (sun-web.xml)
Subelements

The following table describes subelements for the `locale-charset-map` element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;description&quot; on page 52</td>
<td>zero or one</td>
<td>Specifies an optional text description of a mapping.</td>
</tr>
</tbody>
</table>

Attributes

The following table describes attributes for the `locale-charset-map` element.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>locale</td>
<td>none</td>
<td>Specifies the locale name.</td>
</tr>
<tr>
<td>agent</td>
<td>none (optional)</td>
<td>Specifies the type of client that interacts with the application server. For a given locale, different agents can have different preferred character encodings. The value of this attribute must exactly match the value of the <code>user-agent</code> HTTP request header sent by the client. See Table A–46 for more information.</td>
</tr>
<tr>
<td>charset</td>
<td>none</td>
<td>Specifies the character encoding to which the locale maps.</td>
</tr>
</tbody>
</table>

Example Agents

The following table specifies example agent attribute values.

<table>
<thead>
<tr>
<th>Agent</th>
<th>user-agent Header and agent Attribute Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Internet Explorer 5.00 for Windows 2000</td>
<td>Mozilla/4.0 (compatible; MSIE 5.01; Windows NT 5.0)</td>
</tr>
<tr>
<td>Netscape 4.7.7 for Windows 2000</td>
<td>Mozilla/4.77 [en] (Windows NT 5.0; U)</td>
</tr>
<tr>
<td>Netscape 4.7 for Solaris</td>
<td>Mozilla/4.7 [en] (X11; u; Sun OS 5.6 sun4u)</td>
</tr>
</tbody>
</table>

localpart

Specifies the local part of a QNAME.

Superelements

"service-qname" on page 104, "wsdl-port" on page 121 (sun-web.xml, sun-ejb-jar.xml)
**Subelements**
none - contains data

**login-config**
Specifies the authentication configuration for an EJB web service endpoint. Not needed for servlet web service endpoints. A servlet’s security configuration is contained in the web.xml file.

**Superelements**
"webservice-endpoint" on page 120 (sun-web.xml, sun-ejb-jar.xml)

**Subelements**
The following table describes subelements for the login-config element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;auth-method&quot; on page 34</td>
<td>only one</td>
<td>Specifies the authentication method.</td>
</tr>
<tr>
<td>&quot;realm&quot; on page 93</td>
<td>zero or one</td>
<td>Specifies the name of the realm used to process all authentication requests.</td>
</tr>
</tbody>
</table>

**manager-properties**
Specifies session manager properties.

**Superelements**
"session-manager" on page 107 (sun-web.xml)

**Subelements**
The following table describes subelements for the manager-properties element.
Properties

The following table describes properties for the `manager-properties` element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reapIntervalSeconds</td>
<td>60</td>
<td>Specifies the number of seconds between checks for expired sessions. This is also the interval at which sessions are passivated if maxSessions is exceeded. If persistenceFrequency is set to time-based, active sessions are stored at this interval. To prevent data inconsistency, set this value lower than the frequency at which session data changes. For example, this value should be as low as possible (1 second) for a hit counter servlet on a frequently accessed web site, or the last few hits might be lost each time the server is restarted. Applicable only if the persistence-type attribute of the parent &quot;session-manager&quot; on page 107 element is file or replicated.</td>
</tr>
<tr>
<td>maxSessions</td>
<td>-1</td>
<td>Specifies the maximum number of sessions that are permitted in the cache, or -1 for no limit. After this, an attempt to create a new session causes an IllegalStateException to be thrown. If the persistence-type attribute of the parent &quot;session-manager&quot; on page 107 element is file or replicated, the session manager passivates sessions to the persistent store when this maximum is reached.</td>
</tr>
<tr>
<td>sessionFilename</td>
<td>One of the following: dom</td>
<td>Specifies the absolute or relative path to the directory in which the session state is preserved between application restarts, if preserving the state is possible. A relative path is relative to the temporary directory for this web application. To disable preservation of the session state, set this property's value to an empty string. Applicable only if the persistence-type attribute of the parent &quot;session-manager&quot; on page 107 element is memory.</td>
</tr>
</tbody>
</table>

| domain-dir/generated/jsp/module-name/context-path_SESSIONS.ser |
| domain-dir/generated/jsp/app-name/module-name/context-path_SESSIONS.ser |
### Properties (Continued)

<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| persistenceFrequency | web-method    | Specifies how often the session state is stored. Allowed values are as follows:  
  ■ web-method - The session state is stored at the end of each web request prior to sending a response back to the client. This mode provides the best guarantee that the session state is fully updated in case of failure.  
  ■ time-based - The session state is stored in the background at the frequency set by reapIntervalSeconds. This mode provides less of a guarantee that the session state is fully updated. However, it can provide a significant performance improvement because the state is not stored after each request.  
Applicable only if the persistence-type attribute of the parent "session-manager" on page 107 element is replicated. |

### mapping-properties

This element is not implemented.

### Superelements

"cmp" on page 44 (sun-ejb-jar.xml)

### max-cache-size

Specifies the maximum number of beans allowable in cache. A value of zero indicates an unbounded cache. In reality, there is no hard limit. The max-cache-size limit is just a hint to the cache implementation. Default is 512.

Applies to stateful session beans and entity beans.

### Superelements

"bean-cache" on page 35 (sun-ejb-jar.xml)

### Subelements

none - contains data
**max-pool-size**

Specifies the maximum number of bean instances in the pool. Values are from 0 (1 for message-driven bean) to MAX_INTEGER. A value of 0 means the pool is unbounded. Default is 64.

Applies to all beans.

**Superelements**

“bean-pool” on page 36 (sun-ejb-jar.xml)

**Subelements**

none - contains data

**max-wait-time-in-millis**

This element is deprecated. Do not use.

**Superelements**

“bean-pool” on page 36 (sun-ejb-jar.xml)

**mdb-connection-factory**

Specifies the connection factory associated with a message-driven bean. Queue or Topic type must be consistent with the Java Message Service Destination type associated with the message-driven bean class.

**Superelements**

“ejb” on page 53 (sun-ejb-jar.xml)

**Subelements**

The following table describes subelements for the `mdb-connection-factory` element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“jndi-name” on page 65</td>
<td>only one</td>
<td>Specifies the absolute <code>jndi-name</code>.</td>
</tr>
</tbody>
</table>
### mdb-resource-adapter

Specifies runtime configuration information for a message-driven bean.

#### Superelements

"ejb" on page 53 (sun-ejb-jar.xml)

#### Subelements

The following table describes subelements for the mdb-resource-adapter element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;resource-adapter-mid&quot;</td>
<td>zero or one</td>
<td>Specifies a resource adapter module ID.</td>
</tr>
<tr>
<td>&quot;activation-config&quot;</td>
<td>one or more</td>
<td>Specifies an activation configuration.</td>
</tr>
</tbody>
</table>

### message

Specifies the methods or operations to which message security requirements apply.

#### Superelements

"message-security" on page 79 (sun-web.xml, sun-ejb-jar.xml)

#### Subelements

The following table describes subelements for the message element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;java-method&quot;</td>
<td>zero or one</td>
<td>Specifies the methods or operations to which message security requirements apply.</td>
</tr>
</tbody>
</table>
message-destination

Specifies the name of a logical message-destination defined within an application. The message-destination-name matches the corresponding message-destination-name in the corresponding Java EE deployment descriptor file. Use when the message destination reference in the corresponding Java EE deployment descriptor file specifies a message-destination-link to a logical message-destination.

**Superelements**

"sun-web-app" on page 111 (sun-web.xml), "enterprise-beans" on page 58 (sun-ejb-jar.xml)

**Subelements**

The following table describes subelements for the message-destination element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;message-destination-name&quot; on page 78</td>
<td>only one</td>
<td>Specifies the name of a logical message destination defined within the corresponding Java EE deployment descriptor file.</td>
</tr>
<tr>
<td>&quot;jndi-name&quot; on page 65</td>
<td>only one</td>
<td>Specifies the jndi-name of the associated entity.</td>
</tr>
</tbody>
</table>

message-destination-name

Specifies the name of a logical message destination defined within the corresponding Java EE deployment descriptor file.

**Superelements**

"message-destination" on page 78 (sun-web.xml, sun-ejb-jar.xml)

**Subelements**

none - contains data
message-destination-ref

Directly binds a message destination reference to the JNDI name of a queue, topic, or other physical destination. Use only when the message destination reference in the corresponding Java EE deployment descriptor file does not specify a message-destination-link to a logical message-destination.

Superelements

"sun-web-app" on page 111 (sun-web.xml), "ejb" on page 53 (sun-ejb-jar.xml)

Subelements

The following table describes subelements for the message-destination-ref element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;message-destination-ref-name&quot; on page 79</td>
<td>only one</td>
<td>Specifies the name of a physical message destination defined within the corresponding Java EE deployment descriptor file.</td>
</tr>
<tr>
<td>&quot;jndi-name&quot; on page 65</td>
<td>only one</td>
<td>Specifies the jndi-name of the associated entity.</td>
</tr>
</tbody>
</table>

message-destination-ref-name

Specifies the name of a physical message destination defined within the corresponding Java EE deployment descriptor file.

Superelements

"message-destination-ref" on page 79 (sun-web.xml, sun-ejb-jar.xml)

Subelements

none - contains data

message-security

Specify message security requirements.

- If the grandparent element is "webservice-endpoint" on page 120, these requirements pertain to request and response messages of the endpoint.
- If the grandparent element is "port-info" on page 88, these requirements pertain to the port of the referenced service.
**Superelements**

"message-security-binding" on page 80 (sun-web.xml, sun-ejb-jar.xml)

---

**Subelements**

The following table describes subelements for the `message-security` element.

### TABLE A–55 message-security Subelements

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;message&quot; on page 77</td>
<td>one or more</td>
<td>Specifies the methods or operations to which message security requirements apply.</td>
</tr>
<tr>
<td>&quot;request-protection&quot; on page 95</td>
<td>zero or one</td>
<td>Defines the authentication policy requirements of the application's request processing.</td>
</tr>
<tr>
<td>&quot;response-protection&quot; on page 99</td>
<td>zero or one</td>
<td>Defines the authentication policy requirements of the application's response processing.</td>
</tr>
</tbody>
</table>

---

**message-security-binding**

Specifies a custom authentication provider binding for a parent "webservice-endpoint" on page 120 or "port-info" on page 88 element in one or both of these ways:

- By binding to a specific provider
- By specifying the message security requirements enforced by the provider

---

**Superelements**

"webservice-endpoint" on page 120, "port-info" on page 88 (sun-web.xml, sun-ejb-jar.xml)

---

**Subelements**

The following table describes subelements for the `message-security-binding` element.

### TABLE A–56 message-security-binding Subelements

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;message-security&quot; on page 79</td>
<td>zero or more</td>
<td>Specifies message security requirements.</td>
</tr>
</tbody>
</table>

---

**Attributes**

The following table describes attributes for the `message-security-binding` element.

---
## message-security-binding Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auth-layer</td>
<td>none</td>
<td>Specifies the message layer at which authentication is performed. The value must be SOAP.</td>
</tr>
<tr>
<td>provider-id</td>
<td>none (optional)</td>
<td>Specifies the authentication provider used to satisfy application-specific message security requirements. If this attribute is not specified, a default provider is used, if it is defined for the message layer. if no default provider is defined, authentication requirements defined in the message-security-binding are not enforced.</td>
</tr>
</tbody>
</table>

### method

Specifies a bean method.

#### Superelements

“flush-at-end-of-method” on page 60 (sun-ejb-jar.xml)

#### Subelements

The following table describes subelements for the method element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“description” on page 52</td>
<td>zero or one</td>
<td>Specifies an optional text description.</td>
</tr>
<tr>
<td>&quot;ejb-name&quot; on page 56</td>
<td>zero or one</td>
<td>Matches the ejb-name in the corresponding ejb-jar.xml file.</td>
</tr>
<tr>
<td>&quot;method-name&quot; on page 82</td>
<td>only one</td>
<td>Specifies a method name.</td>
</tr>
<tr>
<td>&quot;method-intf&quot; on page 81</td>
<td>zero or one</td>
<td>Specifies the method interface to distinguish between methods with the same name in different interfaces.</td>
</tr>
<tr>
<td>&quot;method-params&quot; on page 82</td>
<td>zero or one</td>
<td>Specifies fully qualified Java type names of method parameters.</td>
</tr>
</tbody>
</table>

### method-intf

Specifies the method interface to distinguish between methods with the same name in different interfaces. Allowed values are Home, Remote, LocalHome, and Local.

#### Superelements

“method” on page 81 (sun-ejb-jar.xml)
Subelements

none - contains data

**method-name**

Specifies a method name or * (an asterisk) for all methods. If a method is overloaded, specifies all methods with the same name.

Superelements

```
"java-method" on page 64 (sun-web.xml, sun-ejb-jar.xml); "finder" on page 60,
"query-method" on page 92, “method” on page 81 (sun-ejb-jar.xml)
```

Subelements

none - contains data

**Examples**

```
<method-name>findTeammates</method-name>

<method-name>*</method-name>
```

**method-param**

Specifies the fully qualified Java type name of a method parameter.

Superelements

```
“method-params” on page 82 (sun-web.xml, sun-ejb-jar.xml)
```

Subelements

none - contains data

**method-params**

Specifies fully qualified Java type names of method parameters.

Superelements

```
"java-method" on page 64 (sun-web.xml, sun-ejb-jar.xml); "query-method" on page 92,
“method” on page 81 (sun-ejb-jar.xml)
```
The following table describes subelements for the method-params element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;method-param&quot; on page 82</td>
<td>zero or more</td>
<td>Specifies the fully qualified Java type name of a method parameter.</td>
</tr>
</tbody>
</table>

**name**

Specifies the name of the entity.

**Subelements**

"call-property" on page 41, "default-resource-principal" on page 51, "stub-property" on page 110 (sun-web.xml, sun-ejb-jar.xml); "enterprise-beans" on page 58, "principal" on page 89, "property (with subelements)" on page 91 (sun-ejb-jar.xml)

**Subelements**

none - contains data

**namespaceURI**

Specifies the namespace URI.

**Superelements**

"service-qname" on page 104, "wsdl-port" on page 121 (sun-web.xml, sun-ejb-jar.xml)

**Subelements**

none - contains data
**one-one-finders**

Describes the finders for CMP 1.1 beans.

**Superelements**

“cmp” on page 44 (sun-ejb-jar.xml)

**Subelements**

The following table describes subelements for the one-one-finders element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“finder” on page 60</td>
<td>one or more</td>
<td>Describes the finders for CMP 1.1 with a method name and query.</td>
</tr>
</tbody>
</table>

**operation-name**

Specifies the WSDL name of an operation of a web service.

**Superelements**

“message” on page 77 (sun-web.xml, sun-ejb-jar.xml)

**Subelements**

none - contains data

**parameter-encoding**

Specifies the default request character encoding and how the web container decodes parameters from forms according to a hidden field value.

If both the “sun-web-app” on page 111 and “locale-charset-info” on page 71 elements have parameter-encoding subelements, the subelement of sun-web-app takes precedence. For encodings, see [http://java.sun.com/j2se/1.5.0/docs/guide/intl/encoding.doc.html](http://java.sun.com/j2se/1.5.0/docs/guide/intl/encoding.doc.html).
Superelements

"locale-charset-info" on page 71, "sun-web-app" on page 111 (sun-web.xml)

Subelements

none

Attributes

The following table describes attributes for the parameter-encoding element.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>form-hint-field</td>
<td>none</td>
<td>(optional) The name of the hidden field in the form. This field specifies the character encoding the web container uses for request.getParameter and request.getReader calls when the charset is not set in the request's content-type header.</td>
</tr>
<tr>
<td>default-charset</td>
<td>ISO-8859-1</td>
<td>(optional) The default request character encoding.</td>
</tr>
</tbody>
</table>

pass-by-reference

Specifies the passing method used by a servlet or enterprise bean calling a remote interface method in another bean that is colocated within the same process.

- If false (the default if this element is not present), this application uses pass-by-value semantics.
- If true, this application uses pass-by-reference semantics.
**Note** – The *pass-by-reference* element only applies to remote calls. As defined in the EJB 2.1 specification, section 5.4, calls to local interfaces use pass-by-reference semantics.

If the *pass-by-reference* element is set to its default value of *false*, the passing semantics for calls to remote interfaces comply with the EJB 2.1 specification, section 5.4. If set to *true*, remote calls involve pass-by-reference semantics instead of pass-by-value semantics, contrary to this specification.

Portable programs cannot assume that a copy of the object is made during such a call, and thus that it’s safe to modify the original. Nor can they assume that a copy is not made, and thus that changes to the object are visible to both caller and callee. When this element is set to *true*, parameters and return values should be considered read-only. The behavior of a program that modifies such parameters or return values is undefined.

When a servlet or enterprise bean calls a remote interface method in another bean that is colocated within the same process, by default the Application Server makes copies of all the call parameters in order to preserve the pass-by-value semantics. This increases the call overhead and decreases performance.

However, if the calling method does not change the object being passed as a parameter, it is safe to pass the object itself without making a copy of it. To do this, set the *pass-by-reference* value to *true*.

The setting of this element in the `sun-application.xml` file applies to all EJB modules in the application. For an individually deployed EJB module, you can set the same element in the `sun-ejb-jar.xml` file. If *pass-by-reference* is used at both the bean and application level, the bean level takes precedence.

**Superelements**

"eb" on page 53 (`sun-ejb-jar.xml`)

**Subelements**

none - contains data

**password**

Specifies the password for the principal.

**Superelements**

"default-resource-principal" on page 51 (`sun-web.xml`, `sun-ejb-jar.xml`)
Subelements
none - contains data

pm-descriptors
This element and its subelements are deprecated. Do not use.

Superelements
"enterprise-beans" on page 58 (sun-ejb-jar.xml)

pool-idle-timeout-in-seconds
Specifies the maximum time, in seconds, that a bean instance is allowed to remain idle in the pool. When this timeout expires, the bean instance in a pool becomes a candidate for passivation or deletion. This is a hint to the server. A value of 0 specifies that idle beans remain in the pool indefinitely. Default value is 600.

Applies to stateless session beans, entity beans, and message-driven beans.

Note – For a stateless session bean or a message-driven bean, the bean is removed (garbage collected) when the timeout expires.

Superelements
"bean-pool" on page 36 (sun-ejb-jar.xml)

Subelements
none - contains data

port-component-name
Specifies a unique name for a port component within a web or EJB module.

Superelements
"webservice-endpoint" on page 120 (sun-web.xml, sun-ejb-jar.xml)

Subelements
none - contains data
**port-info**

Specifies information for a port within a web service reference.

Either a service-endpoint-interface or a wsdl-port or both must be specified. If both are specified, wsdl-port specifies the port that the container chooses for container-managed port selection.

The same wsdl-port value must not appear in more than one port-info element within the same service-ref.

If a service-endpoint-interface is using container-managed port selection, its value must not appear in more than one port-info element within the same service-ref.

**Superelements**

"service-ref" on page 104 (sun-web.xml, sun-ejb-jar.xml)

**Subelements**

The following table describes subelements for the port-info element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;service-endpoint-interface&quot; on page 103</td>
<td>zero or one</td>
<td>Specifies the web service reference name relative to java:comp/env.</td>
</tr>
<tr>
<td>&quot;wsdl-port&quot; on page 121</td>
<td>zero or one</td>
<td>Specifies the WSDL port.</td>
</tr>
<tr>
<td>&quot;stub-property&quot; on page 110</td>
<td>zero or more</td>
<td>Specifies JAX-RPC property values that are set on a javax.xml.rpc.Stub object before it is returned to the web service client.</td>
</tr>
<tr>
<td>&quot;call-property&quot; on page 41</td>
<td>zero or more</td>
<td>Specifies JAX-RPC property values that are set on a javax.xml.rpc.Call object before it is returned to the web service client.</td>
</tr>
<tr>
<td>&quot;message-security-binding&quot; on page 80</td>
<td>zero or one</td>
<td>Specifies a custom authentication provider binding.</td>
</tr>
</tbody>
</table>

**prefetch-disabled**

Disables prefetching of entity bean states for the specified query methods.

**Superelements**

"cmp" on page 44 (sun-ejb-jar.xml)
Subelements
The following table describes subelements for the `prefetch-disabled` element.

**TABLE A–63  prefetch-disabled Subelements**

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;query-method&quot; on page 92</td>
<td>one or more</td>
<td>Specifies a query method.</td>
</tr>
</tbody>
</table>

**principal**
Defines a node that specifies a user name on the platform.

**Superelements**
"ejb" on page 53 (sun-ejb-jar.xml)

**Subelements**
The following table describes subelements for the `principal` element.

**TABLE A–64  principal Subelements**

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;name&quot; on page 83</td>
<td>only one</td>
<td>Specifies the name of the user.</td>
</tr>
</tbody>
</table>

**principal-name**
Contains the principal (user) name.

In an enterprise bean, specifies the principal (user) name that has the `run-as` role specified.

**Superelements**
"security-role-mapping" on page 102 (sun-web.xml, sun-ejb-jar.xml), "servlet" on page 105 (sun-web.xml)

**Subelements**
one - contains data

**Attributes**
The following table describes attributes for the `principal-name` element.
TABLE A–65  principal-name Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>class-name</td>
<td>com.sun.enterprise.deployment.PrincipalImpl</td>
<td>(optional) Specifies the custom principal implementation class corresponding to the named principal.</td>
</tr>
</tbody>
</table>

property (with attributes)

Specifies the name and value of a property. A property adds configuration information to its parent element that is one or both of the following:

- Optional with respect to Application Server
- Needed by a system or object that Application Server doesn’t have knowledge of, such as an LDAP server or a Java class

Superelements

Subelements

The following table describes subelements for the property element.

TABLE A–66  property Subelements

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“description” on page 52</td>
<td>zero or one</td>
<td>Specifies an optional text description of a property.</td>
</tr>
</tbody>
</table>

Attributes

The following table describes attributes for the property element.

TABLE A–67  property Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>none</td>
<td>Specifies the name of the property.</td>
</tr>
<tr>
<td>value</td>
<td>none</td>
<td>Specifies the value of the property.</td>
</tr>
</tbody>
</table>

Example

```xml
<property name="reapIntervalSeconds" value="20" />
```
property (with subelements)

Specifies the name and value of a property. A property adds configuration information to its parent element that is one or both of the following:

- Optional with respect to Application Server
- Needed by a system or object that Application Server doesn’t have knowledge of, such as an LDAP server or a Java class

Superelements

Subelements

The following table describes subelements for the property element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“name” on 83</td>
<td>only one</td>
<td>Specifies the name of the property.</td>
</tr>
<tr>
<td>“value” on 118</td>
<td>only one</td>
<td>Specifies the value of the property.</td>
</tr>
</tbody>
</table>

Example

```xml
<property>
  <name>use-unique-table-names</name>
  <value>true</value>
</property>
```

query-filter

Specifies the query filter for the CMP 1.1 finder.

Superelements

“finder” on page 60 (sun-ejb-jar.xml)

Subelements

none - contains data
**query-method**

Specifies a query method.

**Superelements**

"prefetch-disabled" on page 88 (sun-ejb-jar.xml)

**Subelements**

The following table describes subelements for the query-method element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;method-name&quot; on page 82</td>
<td>only one</td>
<td>Specifies a method name.</td>
</tr>
<tr>
<td>&quot;method-params&quot; on page 82</td>
<td>only one</td>
<td>Specifies the fully qualified Java type names of method parameters.</td>
</tr>
</tbody>
</table>

**query-ordering**

Specifies the query ordering for the CMP 1.1 finder.

**Superelements**

"finder" on page 60 (sun-ejb-jar.xml)

**Subelements**

none - contains data

**query-params**

Specifies the query parameters for the CMP 1.1 finder.

**Superelements**

"finder" on page 60 (sun-ejb-jar.xml)

**Subelements**

none - contains data
**query-variables**

Specifies variables in the query expression for the CMP 1.1 finder.

**Superelements**

“finder” on page 60 ([sun-ejb-jar.xml](#))

**Subelements**

none - contains data

---

**realm**

Specifies the name of the realm used to process all authentication requests associated with this application. If this element is not specified or does not match the name of a configured realm, the default realm is used. For more information about realms, see "Realm Configuration" in *GlassFish v3 Application Server Developer’s Guide*.

**Superelements**

“as-context” on page 34, “login-config” on page 73 ([sun-ejb-jar.xml](#))

**Subelements**

none - contains data

---

**refresh-field**

Specifies a field that gives the application component a programmatic way to refresh a cached entry.

**Superelements**

“cache-mapping” on page 40 ([sun-web.xml](#))

**Subelements**

none
Attributes

The following table describes attributes for the refresh-field element.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>none</td>
<td>Specifies the input parameter name.</td>
</tr>
<tr>
<td>scope</td>
<td>request.parameter</td>
<td>(optional) Specifies the scope from which the input parameter is retrieved. Allowed values are context.attribute, request.header, request.parameter, request.cookie, session.id, and session.attribute.</td>
</tr>
</tbody>
</table>

**refresh-period-in-seconds**

Specifies the rate at which a read-only-bean must be refreshed from the data source. If the value is less than or equal to zero, the bean is never refreshed; if the value is greater than zero, the bean instances are refreshed at the specified interval. This rate is just a hint to the container. Default is 0 (no refresh).

**Superelements**

“ejb” on page 53 (sun-ejb-jar.xml)

**Subelements**

none - contains data

**removal-timeout-in-seconds**

Specifies the amount of time a bean instance can remain idle in the container before it is removed (timeout). A value of 0 specifies that the container does not remove inactive beans automatically. The default value is 5400.

If removal-timeout-in-seconds is less than or equal to cache-idle-timeout-in-seconds, beans are removed immediately without being passivated.

Applies to stateful session beans.

For related information, see “cache-idle-timeout-in-seconds” on page 40.

**Superelements**

“bean-cache” on page 35 (sun-ejb-jar.xml)
**Subelements**
none - contains data

**remote-home-impl**
Specifies the fully-qualified class name of the generated EJBRmo fclass.

*Note* – This value is automatically generated by the server at deployment or redeployment time. Do not specify it or change it after deployment.

**Superelements**
“gen-classes” on page 61 (sun-ejb-jar.xml)

**Subelements**
none - contains data

**remote-impl**
Specifies the fully-qualified class name of the generated EJBRoject  class.

*Note* – This value is automatically generated by the server at deployment or redeployment time. Do not specify it or change it after deployment.

**Superelements**
“gen-classes” on page 61 (sun-ejb-jar.xml)

**Subelements**
none - contains data

**request-protection**
Defines the authentication policy requirements of the application’s request processing.

**Superelements**
“message-security” on page 79 (sun-web.xml, sun-ejb-jar.xml)
**Subelements**

none

**Attributes**

The following table describes attributes for the `request-protection` element.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auth-source</td>
<td>none</td>
<td>Specifies the type of required authentication, either sender (user name and password) or content (digital signature).</td>
</tr>
<tr>
<td>auth-recipient</td>
<td>none</td>
<td>Specifies whether recipient authentication occurs before or after content authentication. Allowed values are before-content and after-content.</td>
</tr>
</tbody>
</table>

**required**

Specifies whether the authentication method specified in the “auth-method” on page 34 element must be used for client authentication. The value is `true` or `false` (the default).

**Superelements**

“as-context” on page 34 (`sun-ejb-jar.xml`)

**Subelements**

none - contains data

**res-ref-name**

Specifies the `res-ref-name` in the corresponding Java EE deployment descriptor file `resource-ref` entry. The `res-ref-name` element specifies the name of a resource manager connection factory reference. The name must be unique within an enterprise bean.

**Superelements**

“resource-ref” on page 99 (`sun-web.xml`, `sun-ejb-jar.xml`)

**Subelements**

none - contains data
**resize-quantity**

Specifies the number of bean instances to be:

- Created, if a request arrives when the pool has less than "steady-pool-size" on page 108 quantity of beans (applies to pools only for creation). If the pool has more than steady-pool-size minus "resize-quantity" on page 97 of beans, then resize-quantity is still created.

- Removed, when the "pool-idle-timeout-in-seconds" on page 87 timer expires and a cleaner thread removes any unused instances.
  - For caches, when "max-cache-size" on page 75 is reached, resize-quantity beans are selected for passivation using the "victim-selection-policy" on page 118. In addition, the "cache-idle-timeout-in-seconds" on page 40 or "removal-timeout-in-seconds" on page 94 timers passivate beans from the cache.
  - For pools, when the "max-pool-size" on page 76 is reached, resize-quantity beans are selected for removal. In addition, the "pool-idle-timeout-in-seconds" on page 87 timer removes beans until steady-pool-size is reached.

Values are from 0 to MAX_INTEGER. The pool is not resized below the steady-pool-size. Default is 16.

Applies to stateless session beans, entity beans, and message-driven beans.

For EJB pools, the value can be defined in the EJB container. Default is 16.

For EJB caches, the value can be defined in the EJB container. Default is 32.

For message-driven beans, the value can be defined in the EJB container. Default is 2.

**Superelements**

"bean-cache" on page 35, "bean-pool" on page 36 (sun-ejb-jar.xml)

**Subelements**

none - contains data

**resource-adapter-mid**

Specifies the module ID of the resource adapter that is responsible for delivering messages to the message-driven bean.

**Superelements**

"mdb-resource-adapter" on page 77 (sun-ejb-jar.xml)
Subelements
none - contains data

resource-env-ref
Maps the res-ref-name in the corresponding Java EE deployment descriptor file resource-env-ref entry to the absolute jndi-name of a resource.

Superelements
“sun-web-app” on page 111 (sun-web.xml), “ejb” on page 53 (sun-ejb-jar.xml)

Subelements
The following table describes subelements for the resource-env-ref element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“resource-env-ref-name” on page 98</td>
<td>only one</td>
<td>Specifies the res-ref-name in the corresponding Java EE deployment descriptor file resource-env-ref entry.</td>
</tr>
<tr>
<td>“jndi-name” on page 65</td>
<td>only one</td>
<td>Specifies the absolute jndi-name of a resource.</td>
</tr>
</tbody>
</table>

Example
<resource-env-ref>
  <resource-env-ref-name>jms/StockQueueName</resource-env-ref-name>
  <jndi-name>jms/StockQueue</jndi-name>
</resource-env-ref>

resource-env-ref-name
Specifies the res-ref-name in the corresponding Java EE deployment descriptor file resource-env-ref entry.

Superelements
“resource-env-ref” on page 98 (sun-web.xml, sun-ejb-jar.xml)

Subelements
none - contains data
**resource-ref**

Maps the `res-ref-name` in the corresponding Java EE deployment descriptor file `resource-ref` entry to the absolute `jndi-name` of a resource.

**Superelements**

“sun-web-app” on page 111 (sun-web.xml), “ejb” on page 53 (sun-ejb-jar.xml)

**Subelements**

The following table describes subelements for the `resource-ref` element.

<table>
<thead>
<tr>
<th>Element</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Element Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“res-ref-name” on page 96 only one</td>
<td>Specifies the <code>res-ref-name</code> in the corresponding Java EE deployment descriptor file <code>resource-ref</code> entry.</td>
</tr>
<tr>
<td>&quot;jndi-name&quot; on page 65 only one</td>
<td>Specifies the absolute <code>jndi-name</code> of a resource.</td>
</tr>
<tr>
<td>&quot;default-resource-principal&quot; on page 51 zero or one</td>
<td>Specifies the default principal (user) for the resource.</td>
</tr>
</tbody>
</table>

**Example**

```xml
<resource-ref>
  <res-ref-name>jdbc/EmployeeDBName</res-ref-name>
  <jndi-name>jdbc/EmployeeDB</jndi-name>
</resource-ref>
```

**response-protection**

Defines the authentication policy requirements of the application’s response processing.

**Superelements**

“message-security” on page 79 (sun-web.xml, sun-ejb-jar.xml)

**Subelements**

none

**Attributes**

The following table describes attributes for the `response-protection` element.
TABLE A-74 response-protection Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auth-source</td>
<td>none</td>
<td>Specifies the type of required authentication, either sender (username and password) or content (digital signature).</td>
</tr>
<tr>
<td>auth-recipient</td>
<td>none</td>
<td>Specifies whether recipient authentication occurs before or after content authentication. Allowed values are before-content and after-content.</td>
</tr>
</tbody>
</table>

**role-name**

Contains the role-name in the security-role element of the corresponding Java EE deployment descriptor file.

**Superelements**

“security-role-mapping” on page 102 (sun-web.xml, sun-ejb-jar.xml)

**Subelements**

none - contains data

**sas-context**

Describes the sas-context fields.

**Superelements**

“ior-security-config” on page 63 (sun-ejb-jar.xml)

**Subelements**

The following table describes subelements for the sas-context element.
Superelements
"cmp-resource" on page 44 (sun-ejb-jar.xml)

Subelements
The following table describes subelements for the schema-generator-properties element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;property (with subelements)&quot; on page 91</td>
<td>zero or more</td>
<td>Specifies a property name and value.</td>
</tr>
</tbody>
</table>

Properties
The following table describes properties for the schema-generator-properties element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>use-unique-table-names</td>
<td>false</td>
<td>Specifies that generated table names are unique within each application server domain. This property can be overridden during deployment. See GlassFish v3 Application Server Developer's Guide.</td>
</tr>
<tr>
<td>bean-name.field-name.attribute</td>
<td>none</td>
<td>Defines a column attribute. For attribute descriptions, see Table A–78.</td>
</tr>
</tbody>
</table>

The following table lists the column attributes for properties defined in the schema-generator-properties element.
**TABLE A-78**  *schema-generator-properties* Column Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>jdbc-type</td>
<td>Specifies the JDBC type of the column created for the CMP field. The actual SQL type generated is based on this JDBC type but is database vendor specific.</td>
</tr>
<tr>
<td>jdbc-maximum-length</td>
<td>Specifies the maximum number of characters stored in the column corresponding to the CMP field. Applies only when the actual SQL that is generated for the column requires a length.</td>
</tr>
<tr>
<td></td>
<td>For example, a <code>jdbc-maximum-length</code> of 32 on a CMP <code>String</code> field such as <code>firstName</code> normally results in a column definition such as <code>VARCHAR(32)</code>. But if the <code>jdbc-type</code> is <code>CLOB</code> and you are deploying on Oracle, the resulting column definition is <code>CLOB</code>. No length is given, because in an Oracle database, a CLOB has no length.</td>
</tr>
<tr>
<td>jdbc-precision</td>
<td>Specifies the maximum number of digits stored in a column which represents a numeric type.</td>
</tr>
<tr>
<td>jdbc-scale</td>
<td>Specifies the number of digits stored to the right of the decimal point in a column that represents a floating point number.</td>
</tr>
<tr>
<td>jdbc-nullable</td>
<td>Specifies whether the column generated for the CMP field allows null values.</td>
</tr>
</tbody>
</table>

**Example**

```xml
<schema-generator-properties>
  <property>
    <name>Employee.firstName.jdbc-type</name>
    <value>char</value>
  </property>
  <property>
    <name>Employee.firstName.jdbc-maximum-length</name>
    <value>25</value>
  </property>
</schema-generator-properties>
```

**security-role-mapping**

Maps roles to users or groups in the currently active realm. See “Realm Configuration” in *GlassFish v3 Application Server Developer’s Guide*.

The role mapping element maps a role, as specified in the EJB JAR `role-name` entries, to an environment-specific user or group. If it maps to a user, it must be a concrete user which exists in the current realm, who can log into the server using the current authentication method. If it maps to a group, the realm must support groups and the group must be a concrete group which exists in the current realm. To be useful, there must be at least one user in that realm who belongs to that group.
Superelements
“sun-web-app” on page 111 (sun-web.xml), “sun-ejb-jar” on page 111 (sun-ejb-jar.xml)

Subelements
The following table describes subelements for the security-role-mapping element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;role-name&quot; on page 100</td>
<td>only one</td>
<td>Contains the role-name in the security-role element of the corresponding Java EE deployment descriptor file.</td>
</tr>
<tr>
<td>&quot;principal-name&quot; on page 89</td>
<td>one or more if no group-name, otherwise zero or more</td>
<td>Contains a principal (user) name in the current realm. In an enterprise bean, the principal must have the run-as role specified.</td>
</tr>
<tr>
<td>&quot;group-name&quot; on page 61</td>
<td>one or more if no principal-name, otherwise zero or more</td>
<td>Contains a group name in the current realm.</td>
</tr>
</tbody>
</table>

service-endpoint-interface
Specifies the web service reference name relative to java:comp/env.

Superelements
“port-info” on page 88 (sun-web.xml, sun-ejb-jar.xml)

Subelements
none - contains data

service-impl-class
Specifies the name of the generated service implementation class.

Superelements
“service-ref” on page 104 (sun-web.xml, sun-ejb-jar.xml)

Subelements
none - contains data
**service-qname**

Specifies the WSDL service element that is being referred to.

**Superelements**

"service-ref" on page 104, "webservice-endpoint" on page 120 (sun-web.xml, sun-ejb-jar.xml)

**Subelements**

The following table describes subelements for the service-qname element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;namespaceURI&quot; on page 83</td>
<td>only one</td>
<td>Specifies the namespace URI.</td>
</tr>
<tr>
<td>&quot;localpart&quot; on page 72</td>
<td>only one</td>
<td>Specifies the local part of a QName.</td>
</tr>
</tbody>
</table>

**service-ref**

Specifies runtime settings for a web service reference. Runtime information is only needed in the following cases:

- To define the port used to resolve a container-managed port
- To define the default Stub/Call property settings for Stub objects
- To define the URL of a final WSDL document to be used instead of the one associated with the service-ref in the standard Java EE deployment descriptor

**Superelements**

"sun-web-app" on page 111 (sun-web.xml), "ejb" on page 53 (sun-ejb-jar.xml)

**Subelements**

The following table describes subelements for the service-ref element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;service-ref-name&quot; on page 105</td>
<td>only one</td>
<td>Specifies the web service reference name relative to java:comp/env.</td>
</tr>
<tr>
<td>&quot;port-info&quot; on page 88</td>
<td>zero or more</td>
<td>Specifies information for a port within a web service reference.</td>
</tr>
</tbody>
</table>
TABLE A–81 service-ref subelements (Continued)

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;call-property&quot; on page 41</td>
<td>zero or more</td>
<td>Specifies JAX-RPC property values that can be set on a javax.xml.rpc.Call object before it is returned to the web service client.</td>
</tr>
<tr>
<td>&quot;wsdl-override&quot; on page 121</td>
<td>zero or one</td>
<td>Specifies a valid URL pointing to a final WSDL document.</td>
</tr>
<tr>
<td>&quot;service-impl-class&quot; on page 103</td>
<td>zero or one</td>
<td>Specifies the name of the generated service implementation class.</td>
</tr>
<tr>
<td>&quot;service-qname&quot; on page 104</td>
<td>zero or one</td>
<td>Specifies the WSDL service element that is being referenced.</td>
</tr>
</tbody>
</table>

**service-ref-name**

Specifies the web service reference name relative to java:comp/env.

**Superelements**

"service-ref" on page 104 (sun-web.xml, sun-ejb-jar.xml)

**Subelements**

none - contains data

**servlet**

Specifies a principal name for a servlet. Used for the run-as role defined in web-xml.

**Superelements**

"sun-web-app" on page 111 (sun-web.xml)

**Subelements**

The following table describes subelements for the servlet element.

TABLE A–82 servlet Subelements

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;servlet-name&quot; on page 106</td>
<td>only one</td>
<td>Contains the name of a servlet, which is matched to a servlet-name in web.xml.</td>
</tr>
<tr>
<td>&quot;principal-name&quot; on page 89</td>
<td>zero or one</td>
<td>Contains a principal (user) name in the current realm.</td>
</tr>
</tbody>
</table>
TABLE A–82  servlet Subelements  (Continued)

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;webservice-endpoint&quot; on page 120</td>
<td>zero or more</td>
<td>Specifies information about a web service endpoint.</td>
</tr>
</tbody>
</table>

**servlet-impl-class**

Specifies the automatically generated name of the servlet implementation class.

**Superelements**

"webservice-endpoint" on page 120 (sun-web.xml, sun-ejb-jar.xml)

**Subelements**

none - contains data

**servlet-name**

Specifies the name of a servlet, which is matched to a servlet-name in web.xml. This name must be present in web.xml.

**Superelements**

"cache-mapping" on page 40, "servlet" on page 105 (sun-web.xml)

**Subelements**

none - contains data

**session-config**

Specifies session configuration information. Overrides the web container settings for an individual web application.

**Superelements**

"sun-web-app" on page 111 (sun-web.xml)

**Subelements**

The following table describes subelements for the session-config element.
TABLE A–83  session-config Subelements

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;session-manager&quot; on page 107</td>
<td>zero or one</td>
<td>Specifies session manager configuration information.</td>
</tr>
<tr>
<td>&quot;session-properties&quot; on page 107</td>
<td>zero or one</td>
<td>Specifies session properties.</td>
</tr>
<tr>
<td>&quot;cookie-properties&quot; on page 48</td>
<td>zero or one</td>
<td>Specifies session cookie properties.</td>
</tr>
</tbody>
</table>

**session-manager**

Specifies session manager information.

**Superelements**

"session-config" on page 106 (sun-web.xml)

**Subelements**

The following table describes subelements for the session-manager element.

TABLE A–84  session-manager Subelements

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;manager-properties&quot; on page 73</td>
<td>zero or one</td>
<td>Specifies session manager properties.</td>
</tr>
<tr>
<td>&quot;store-properties&quot; on page 108</td>
<td>zero or one</td>
<td>Specifies session persistence (storage) properties.</td>
</tr>
</tbody>
</table>

**Attributes**

The following table describes attributes for the session-manager element.

TABLE A–85  session-manager Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>persistence-type</td>
<td>memory</td>
<td>(optional) Specifies the session persistence mechanism. Allowed values are memory, file, and replicated.</td>
</tr>
</tbody>
</table>

**session-properties**

Specifies session properties.

**Superelements**

"session-config" on page 106 (sun-web.xml)
Subelements
The following table describes subelements for the session-properties element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;property (with attributes)&quot; on page 90</td>
<td>zero or more</td>
<td>Specifies a property, which has a name and a value.</td>
</tr>
</tbody>
</table>

Properties
The following table describes properties for the session-properties element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeoutSeconds</td>
<td>1800</td>
<td>Specifies the default maximum inactive interval (in seconds) for all sessions created in this web module. If set to 0 or less, sessions in this web module never expire. If a session-timeout element is specified in the web.xml file, the session-timeout value overrides any timeoutSeconds value. If neither session-timeout nor timeoutSeconds is specified, the timeoutSeconds default is used. Note that the session-timeout element in web.xml is specified in minutes, not seconds.</td>
</tr>
<tr>
<td>enableCookies</td>
<td>true</td>
<td>Uses cookies for session tracking if set to true.</td>
</tr>
<tr>
<td>enableURLRewriting</td>
<td>true</td>
<td>Enables URL rewriting. This provides session tracking via URL rewriting when the browser does not accept cookies. You must also use an encodeURL or encodeRedirectURL call in the servlet or JSP.</td>
</tr>
</tbody>
</table>

steady-pool-size
Specifies the initial and minimum number of bean instances that are maintained in the pool. Default is 32. Applies to stateless session beans and message-driven beans.

Superelements
"bean-pool" on page 36 (sun-ejb-jar.xml)

Subelements
none - contains data

store-properties
Specifies session persistence (storage) properties.
Superelements

"session-manager" on page 107 (sun-web.xml)

Subelements

The following table describes subelements for the store-properties element.

TABLE A–88 store-properties Subelements

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;property (with attributes)&quot; on page 90</td>
<td>zero or more</td>
<td>Specifies a property, which has a name and a value.</td>
</tr>
</tbody>
</table>

Properties

The following table describes properties for the store-properties element.

TABLE A–89 store-properties Properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory</td>
<td>domain-dir/generated/jsp/app-name/app-name_war</td>
<td>Specifies the absolute or relative path name of the directory into which individual session files are written. A relative path is relative to the temporary work directory for this web application. Applicable only if the persistence-type attribute of the parent &quot;session-manager&quot; on page 107 element is file.</td>
</tr>
</tbody>
</table>
| persistenceScope | session | Specifies how much of the session state is stored. Allowed values are as follows:  
- **session** - The entire session state is stored every time. This mode provides the best guarantee that your session data is correctly stored for any distributable web application.  
- **modified-session** - The entire session state is stored if it has been modified. A session is considered to have been modified if HttpSession.setAttribute() or HttpSession.removeAttribute() was called. You must guarantee that setAttribute() is called every time an attribute is changed. This is not a Java EE specification requirement, but it is required for this mode to work properly.  
- **modified-attribute** - Only modified session attributes are stored. For this mode to work properly, you must follow some guidelines, which are explained immediately following this table. Applicable only if the persistence-type attribute of the parent "session-manager" on page 107 element is replicated. |

If the persistenceScope store property is set to modified-attribute, a web application must follow these guidelines:
- Call `setAttribute()` every time the session state is modified.
- Make sure there are no cross-references between attributes. The object graph under each distinct attribute key is serialized and stored separately. If there are any object cross references between the objects under each separate key, they are not serialized and deserialized correctly.
- Distribute the session state across multiple attributes, or at least between a read-only attribute and a modifiable attribute.

**stub-property**

Specifies JAX-RPC property values that are set on a `javax.xml.rpc.Stub` object before it is returned to the web service client. The property names can be any properties supported by the JAX-RPC Stub implementation.

**Superelements**

![port-info](page 88) (`sun-web.xml`, `sun-ejb-jar.xml`)

**Subelements**

The following table describes subelements for the `stub-property` element.

<table>
<thead>
<tr>
<th>TABLE A–90</th>
<th>stub-property subelements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Element</td>
<td>Required</td>
</tr>
<tr>
<td>&quot;name&quot; on page 83</td>
<td>only one</td>
</tr>
<tr>
<td>&quot;value&quot; on page 118</td>
<td>only one</td>
</tr>
</tbody>
</table>

**Properties**

The following table describes properties for the `stub-property` element.

<table>
<thead>
<tr>
<th>TABLE A–91</th>
<th>stub-property properties</th>
</tr>
</thead>
<tbody>
<tr>
<td>Property</td>
<td>Default</td>
</tr>
<tr>
<td>jbi-enabled</td>
<td>true</td>
</tr>
</tbody>
</table>

**Example**

```xml
<service-ref>
  <service-ref-name>service/FooProxy</service-ref-name>
  <port-info>
```

GlassFish v3 Application Server Application Deployment Guide • May 2008
<service-endpoint-interface>a.FooPort</service-endpoint-interface>
<wSDL-port>
  <namespaceURI>urn:Foo</namespaceURI>
  <localpart>FooPort</localpart>
</wSDL-port>
<stub-property>
  <name>javax.xml.rpc.service.endpoint.address</name>
  <value>http://localhost:8080/a/Foo</value>
</stub-property>
</port-info>
</service-ref>

**sun-ejb-jar**

Defines the Application Server specific configuration for an EJB JAR file. This is the root element; there can only be one `sun-ejb-jar` element in a `sun-ejb-jar.xml` file. See “The sun-ejb-jar.xml File” on page 28.

**Superelements**

none

**Subelements**

The following table describes subelements for the `sun-ejb-jar` element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“security-role-mapping” on page 102</td>
<td>zero or more</td>
<td>Maps a role in the corresponding Java EE XML file to a user or group.</td>
</tr>
<tr>
<td>“enterprise-beans” on page 58</td>
<td>only one</td>
<td>Describes all the runtime properties for an EJB JAR file in the application.</td>
</tr>
</tbody>
</table>

**sun-web-app**

Defines Application Server specific configuration for a web module. This is the root element; there can only be one `sun-web-app` element in a `sun-web.xml` file. See “The sun-web.xml File” on page 24.

**Superelements**

none
**Subelements**

The following table describes subelements for the `sun-web-app` element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;context-root&quot; on page 48</td>
<td>zero or one</td>
<td>Contains the web context root for the web application.</td>
</tr>
<tr>
<td>&quot;security-role-mapping&quot; on page 102</td>
<td>zero or more</td>
<td>Maps roles to users or groups in the currently active realm.</td>
</tr>
<tr>
<td>&quot;servlet&quot; on page 105</td>
<td>zero or more</td>
<td>Specifies a principal name for a servlet, which is used for the run-as role defined in <code>web.xml</code>.</td>
</tr>
<tr>
<td>&quot;idempotent-url-pattern&quot; on page 62</td>
<td>zero or more</td>
<td>Specifies a URL pattern for idempotent requests.</td>
</tr>
<tr>
<td>&quot;session-config&quot; on page 106</td>
<td>zero or one</td>
<td>Specifies session manager, session cookie, and other session-related information.</td>
</tr>
<tr>
<td>&quot;ejb-ref&quot; on page 56</td>
<td>zero or more</td>
<td>Maps the absolute JNDI name to the <code>ejb-ref</code> in the corresponding Java EE XML file.</td>
</tr>
<tr>
<td>&quot;resource-ref&quot; on page 99</td>
<td>zero or more</td>
<td>Maps the absolute JNDI name to the <code>resource-ref</code> in the corresponding Java EE XML file.</td>
</tr>
<tr>
<td>&quot;resource-env-ref&quot; on page 98</td>
<td>zero or more</td>
<td>Maps the absolute JNDI name to the <code>resource-env-ref</code> in the corresponding Java EE XML file.</td>
</tr>
<tr>
<td>&quot;service-ref&quot; on page 104</td>
<td>zero or more</td>
<td>Specifies runtime settings for a web service reference.</td>
</tr>
<tr>
<td>&quot;message-destination-ref&quot; on page 79</td>
<td>zero or more</td>
<td>Specifies the name of a physical message destination.</td>
</tr>
<tr>
<td>&quot;cache&quot; on page 37</td>
<td>zero or one</td>
<td>Configures caching for web application components.</td>
</tr>
<tr>
<td>&quot;class-loader&quot; on page 42</td>
<td>zero or one</td>
<td>Specifies class loader configuration information.</td>
</tr>
<tr>
<td>&quot;jsp-config&quot; on page 66</td>
<td>zero or one</td>
<td>Specifies JSP configuration information.</td>
</tr>
<tr>
<td>&quot;locale-charset-info&quot; on page 71</td>
<td>zero or one</td>
<td>Deprecated. Use the <code>parameter-encoding</code> subelement of <code>sun-web-app</code> instead.</td>
</tr>
<tr>
<td>&quot;parameter-encoding&quot; on page 84</td>
<td>zero or one</td>
<td>Determines the default request character encoding and how the web container decodes parameters from forms according to a hidden field value.</td>
</tr>
<tr>
<td>&quot;property (with attributes)&quot; on page 90</td>
<td>zero or more</td>
<td>Specifies a property, which has a name and a value.</td>
</tr>
<tr>
<td>&quot;message-destination&quot; on page 78</td>
<td>zero or more</td>
<td>Specifies the name of a logical message destination.</td>
</tr>
</tbody>
</table>
**Attributes**

The following table describes attributes for the `sun-web-app` element.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>error-url</code></td>
<td>(blank)</td>
<td>(optional) Not implemented. Do not use.</td>
</tr>
<tr>
<td><code>httpservlet-security-provider</code></td>
<td>none</td>
<td>(optional) Specifies the <code>HttpServlet</code> message layer provider that the web container's <code>servlet-auth-constraint</code> processing calls.</td>
</tr>
</tbody>
</table>

**Properties**

The following table describes properties for the `sun-web-app` element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| `allowLinking` | false  | If true, resources in this web application that are symbolic links are served. You can also define this property for a virtual server. Web applications on the virtual server that do not define this property use the virtual server's value.  
**Caution** – Setting this property to true on Windows systems exposes JSP source code. |
### Table A-95  sun-web-app Properties  (Continued)

<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| alternatedocroot_n | none    | Specifies an alternate document root (docroot), where \( n \) is a positive integer that allows specification of more than one. Alternate docroots allow web applications to serve requests for certain resources from outside their own docroot, based on whether those requests match one (or more) of the URI patterns of the web application’s alternate docroots. If a request matches an alternate docroot’s URI pattern, it is mapped to the alternate docroot by appending the request URI (minus the web application’s context root) to the alternate docroot’s physical location (directory). If a request matches multiple URI patterns, the alternate docroot is determined according to the following precedence order:  
  ■ Exact match  
  ■ Longest path match  
  ■ Extension match  
  
  For example, the following properties specify three alternate docroots. The URI pattern of the first alternate docroot uses an exact match, whereas the URI patterns of the second and third alternate docroots use extension and longest path prefix matches, respectively.

  `<property name="alternatedocroot_1" value="from=/my.jpg dir=/srv/images/jpg"/>
  <property name="alternatedocroot_2" value="from=*.jpg dir=/srv/images/jpg"/>
  <property name="alternatedocroot_3" value="from=/jpg/* dir=/src/images"/>

  The value of each alternate docroot has two components: The first component, from, specifies the alternate docroot’s URI pattern, and the second component, dir, specifies the alternate docroot’s physical location (directory). Spaces are allowed in the dir component.  

  You can set this property for all the web applications on a specific virtual server. |
| crossContextAllowed | true    | If true, allows this web application to access the contexts of other web applications using the ServletContext. getContext() method. |
| relativeRedirect Allowed | false  | If true, allows this web application to send a relative URL to the client using HttpServletResponse.sendRedirect(), and instructs the web container not to translate any relative URLs to fully qualified ones. |
### TABLE A-95 sun-web-app Properties (Continued)

<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reuseSessionID</td>
<td>false</td>
<td>If true, sessions generated for this web application use the session ID specified in the request.</td>
</tr>
<tr>
<td>securePagesWithPragma</td>
<td>true</td>
<td>Set this property to false to ensure that for this web application file downloads using SSL work properly in Internet Explorer. You can set this property for all the web applications on a specific virtual server.</td>
</tr>
<tr>
<td>singleThreadedServletPoolSize</td>
<td>5</td>
<td>Specifies the maximum number of servlet instances allocated for each SingleThreadModel servlet in the web application.</td>
</tr>
<tr>
<td>tempdir</td>
<td>domain-dir/generated/app-name or domain-dir/generated/module-name</td>
<td>Specifies a temporary directory for use by this module. This value is used to construct the value of the javax.servlet.context.tempdir context attribute. Compiled JSP files are also placed in this directory.</td>
</tr>
<tr>
<td>useResponseCTForHeaders</td>
<td>false</td>
<td>If true, response headers are encoded using the response's charset instead of the default (UTF-8).</td>
</tr>
</tbody>
</table>

### tie-class

Specifies the automatically generated name of a tie implementation class for a port component.

### Superelements

"webservice-endpoint" on page 120 (sun-web.xml, sun-ejb-jar.xml)

### Subelements

none - contains data

### timeout

Specifies the "cache-mapping" on page 40 specific maximum amount of time in seconds that an entry can remain in the cache after it is created or refreshed. If not specified, the default is the value of the timeout attribute of the "cache" on page 37 element.

### Superelements

"cache-mapping" on page 40 (sun-web.xml)
Subelements
none - contains data

Attributes
The following table describes attributes for the timeout element.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>none</td>
<td>Specifies the timeout input parameter, whose value is interpreted in seconds. The field's type must be java.lang.Long or java.lang.Integer.</td>
</tr>
<tr>
<td>scope</td>
<td>request.attribute</td>
<td>(optional) Specifies the scope from which the input parameter is retrieved. Allowed values are context.attribute, request.header, request.parameter, request.cookie, request.attribute, and session.attribute.</td>
</tr>
</tbody>
</table>

transport-config
Specifies the security transport information.

Superelements
"ior-security-config" on page 63 (sun-ejb-jar.xml)

Subelements
The following table describes subelements for the transport-config element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;integrity&quot; on page 63</td>
<td>only one</td>
<td>Specifies if the target supports integrity-protected messages. The values are NONE, SUPPORTED, or REQUIRED.</td>
</tr>
<tr>
<td>&quot;confidentiality&quot; on page 46</td>
<td>only one</td>
<td>Specifies if the target supports privacy-protected messages. The values are NONE, SUPPORTED, or REQUIRED.</td>
</tr>
<tr>
<td>&quot;establish-trust-in-target&quot; on page 59</td>
<td>only one</td>
<td>Specifies if the target is capable of authenticating to a client. The values are NONE, SUPPORTED, or REQUIRED.</td>
</tr>
<tr>
<td>&quot;establish-trust-in-client&quot; on page 59</td>
<td>only one</td>
<td>Specifies if the target is capable of authenticating a client. The values are NONE, SUPPORTED, or REQUIRED.</td>
</tr>
</tbody>
</table>
transport-guarantee

Specifies that the communication between client and server is NONE, INTEGRAL, or CONFIDENTIAL.

- **NONE** means the application does not require any transport guarantees.
- **INTEGRAL** means the application requires that the data sent between client and server be sent in such a way that it can’t be changed in transit.
- **CONFIDENTIAL** means the application requires that the data be transmitted in a fashion that prevents other entities from observing the contents of the transmission.

In most cases, a value of INTEGRAL or CONFIDENTIAL indicates that the use of SSL is required.

**Superelements**

“webservices-endpoint” on page 120 (sun-web.xml, sun-ejb-jar.xml)

**Subelements**

one - contains data

unique-id

Contains the unique ID for the application. This value is automatically updated each time the application is deployed or redeployed. Do not edit this value.

**Superelements**

“enterprise-beans” on page 58 (sun-ejb-jar.xml)

**Subelements**

none - contains data

url-pattern

Specifies a servlet URL pattern for which caching is enabled. See the Servlet 2.4 specification section SRV. 11.2 for applicable patterns.

**Superelements**

“cache-mapping” on page 40 (sun-web.xml)
Subelements
none - contains data

use-thread-pool-id
Specifies the thread pool from which threads are selected for remote invocations of this bean.

Superelements
"ejb" on page 53 (sun-ejb-jar.xml)

Subelements
none - contains data

value
Specifies the value of the entity.

Superelements
"call-property" on page 41, "stub-property" on page 110 (sun-web.xml, sun-ejb-jar.xml);
"property (with subelements)" on page 91 (sun-ejb-jar.xml)

Subelements
none - contains data

victim-selection-policy
Specifies how stateful session beans are selected for passivation. Possible values are First In, First Out (FIFO), Least Recently Used (LRU), Not Recently Used (NRU). The default value is NRU, which is actually pseudo-LRU.

Note – You cannot plug in your own victim selection algorithm.
The victims are generally passivated into a backup store (typically a file system or database). This store is cleaned during startup, and also by a periodic background process that removes idle entries as specified by removal-timeout-in-seconds. The backup store is monitored by a background thread (or sweeper thread) to remove unwanted entries.

Applies to stateful session beans.

**Superelements**

"bean-cache" on page 35 (sun-ejb-jar.xml)

**Subelements**

none - contains data

**Example**

```xml
<victim-selection-policy>LRU</victim-selection-policy>
```

If both SSL2 and SSL3 are enabled, the server tries SSL3 encryption first. If that fails, the server tries SSL2 encryption. If both SSL2 and SSL3 are enabled for a virtual server, the server tries SSL3 encryption first. If that fails, the server tries SSL2 encryption.

** webservice-description **

Specifies a name and optional publish location for a web service.

**Superelements**

"sun-web-app" on page 111 (sun-web.xml), "enterprise-beans" on page 58 (sun-ejb-jar.xml)

**Subelements**

The following table describes subelements for the webservice-description element.
### Table A-98  webservice-description subelements

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;webservice-description-name&quot; on page 120</td>
<td>only one</td>
<td>Specifies a unique name for the web service within a web or EJB module.</td>
</tr>
<tr>
<td>&quot;wsdl-publish-location&quot; on page 122</td>
<td>zero or one</td>
<td>Specifies the URL of a directory to which a web service’s WSDL is published during deployment.</td>
</tr>
</tbody>
</table>

### webservice-description-name

Specifies a unique name for the web service within a web or EJB module.

**Superelements**

"webservice-description" on page 119 (sun-web.xml, sun-ejb-jar.xml)

**Subelements**

none - contains data

### webservice-endpoint

Specifies information about a web service endpoint.

**Superelements**

"servlet" on page 105 (sun-web.xml), "ejb" on page 53 (sun-ejb-jar.xml)

**Subelements**

The following table describes subelements for the webservice-endpoint element.

### Table A-99  webservice-endpoint subelements

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;port-component-name&quot; on page 87</td>
<td>only one</td>
<td>Specifies a unique name for a port component within a web or EJB module.</td>
</tr>
<tr>
<td>&quot;endpoint-address-uri&quot; on page 57</td>
<td>zero or one</td>
<td>Specifies the automatically generated endpoint address.</td>
</tr>
<tr>
<td>&quot;login-config&quot; on page 73</td>
<td>zero or one</td>
<td>Specifies the authentication configuration for an EJB web service endpoint.</td>
</tr>
</tbody>
</table>
**TABLE A–99**  *webservice-endpoint* subelements *(Continued)*

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;message-security-binding&quot; on page 80</td>
<td>zero or one</td>
<td>Specifies a custom authentication provider binding.</td>
</tr>
<tr>
<td>&quot;transport-guarantee&quot; on page 117</td>
<td>zero or one</td>
<td>Specifies that the communication between client and server is NONE, INTEGRAL, or CONFIDENTIAL.</td>
</tr>
<tr>
<td>&quot;service-qname&quot; on page 104</td>
<td>zero or one</td>
<td>Specifies the WSDL service element that is being referenced.</td>
</tr>
<tr>
<td>&quot;tie-class&quot; on page 115</td>
<td>zero or one</td>
<td>Specifies the automatically generated name of a tie implementation class for a port component.</td>
</tr>
<tr>
<td>&quot;servlet-impl-class&quot; on page 106</td>
<td>zero or one</td>
<td>Specifies the automatically generated name of the generated servlet implementation class.</td>
</tr>
<tr>
<td>&quot;debugging-enabled&quot; on page 50</td>
<td>zero or one</td>
<td>Specifies whether the debugging servlet is enabled for this web service endpoint. Allowed values are true and false (the default).</td>
</tr>
<tr>
<td>&quot;property (with attributes)&quot; on page 90 (sun-web.xml)</td>
<td>zero or more</td>
<td>Specifies a property, which has a name and a value.</td>
</tr>
<tr>
<td>&quot;property (with subelements)&quot; on page 91 (sun-ejb-jar.xml)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**wsdl-overwrite**

Specifies a valid URL pointing to a final WSDL document. If not specified, the WSDL document associated with the service-ref in the standard Java EE deployment descriptor is used.

**Superelements**

"service-ref" on page 104 (sun-web.xml, sun-ejb-jar.xml)

**Subelements**

none - contains data

**Example**

// available via HTTP

// in a file
<wsdl-overwrite>file:/home/user1/myfinalwsdl.wsdl</wsdl-overwrite>

**wsdl-port**

Specifies the WSDL port.
Superelements

"port-info" on page 88 (sun-web.xml, sun-ejb-jar.xml)

Subelements

The following table describes subelements for the wsdl-port element.

<table>
<thead>
<tr>
<th>Element</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;namespaceURI&quot; on page 83</td>
<td>only one</td>
<td>Specifies the namespace URI.</td>
</tr>
<tr>
<td>&quot;localpart&quot; on page 72</td>
<td>only one</td>
<td>Specifies the local part of a QName.</td>
</tr>
</tbody>
</table>

**wsdl-publish-location**

Specifies the URL of a directory to which a web service's WSDL is published during deployment. Any required files are published to this directory, preserving their location relative to the module-specific WSDL directory (META-INF/wsdl or WEB-INF/wsdl).

Superelements

"webservice-description" on page 119 (sun-web.xml, sun-ejb-jar.xml)

Subelements

none - contains data

Example

Suppose you have an ejb.jar file whose webservices.xml file's wsdl-file element contains the following reference:

META-INF/wsdl/a/Foo.wsdl

Suppose your sun-ejb-jar file contains the following element:

<wSDL-publish-location>file:/home/user1/publish</wSDL-publish-location>

The final WSDL is stored in /home/user1/publish/a/Foo.wsdl.
