1 Introduction

In this third lab, we will continue investigating `if` and `while` constructions using functions.

2 Warm-up

2.1 Scalar Product

As we have seen in lab2, the scalar product between two 2D vectors $X_1 = \begin{bmatrix} x_1 \\ y_1 \end{bmatrix}$ and $X_2 = \begin{bmatrix} x_2 \\ y_2 \end{bmatrix}$ is defined as:

$$X_1 \cdot X_2 = x_1 \times x_2 + y_1 \times y_2$$

Write a function `dot_prod(x1: int, y1: int, x2: int, y2: int) -> int` that returns the dot product between X_1 and X_2.

Example

```
>>> dot_prod(1,2,3,4)
11
>>> dot_prod(4,3,3,4)
24
```

3 Sums

3.1 Sum Of Multiples Of 3

Write a function `sum_mult3(m: int, n: int) -> int` that returns the sum of all multiples of 3 starting at `m` (included) and ending a `n` (included).

Example

```
>>> sum_mult_3(2, 12)
30
>>> sum_mult_3(5, 20)
60
```

3.2 Sum Of Multiples Of 3 - 2

Write a function `sum_mult3_2(m: int, n: int) -> int` that returns the sum of all multiples of 3 starting at `m` (included) and ending a `n` (included). This time, You will use a step of 3 in your loop.

Example

```
>>> sum_mult_3_2(2, 12)
30
>>> sum_mult_3_2(5, 20)
60
>>> sum_mult_3_2(0, 10)
```

```
18
```

3.3 Sum With Steps

Write a function `sum_step(m: int, n: int, s: int) -> int` that returns the sum starting at `m` (included) to `n` (included) with a step of `s`.

Example

```
>>> sum_step(1, 9, 3)
12
>>> sum_step(0, 100, 15)
315
```

3.4 Double Sum

Consider the following formula:

$$s_n = \sum_{i=1}^{n} \sum_{j=1}^{n-i} (i + j)$$

Write a function `sum_sum(n: int) -> int` that returns the double sum presented in the above formula.

Example

```
>>> sum_sum(9841)
317587964720
```

4 Sequences

4.1 A Sequence

Consider the following sequence:

$$u_n = \begin{cases} -u_{n-1} + \frac{u_{n-1}}{2} & \text{if } n \text{ is multiple of 3 and is even} \\ \frac{u_{n-1}}{2} & \text{if } n \text{ is multiple of 3} \\ 2 * u_{n-1} & \text{if } n \text{ is even} \\ 3 + u_{n-1} & \text{otherwise} \end{cases}$$

Write a function `my_seq(n: int, u0: float) -> float` that returns the value $u(n)$ as defined above.

Example

```
>>> my_seq(7854, -313.24345)
308.74345
```

5 Computing π

5.1 First Sequence

The following formula called Madhava-Gregory-Leibniz sequence converges toward π for $n \to \infty$:

$$u_n = 4\sum_{k=0}^{n} \frac{(-1)^k}{2k+1}$$

Write a function `pi_seq1(n: int) -> float` that returns u_n as defined above.

Example

```
>>> pi_seq1(10)
3.232315809405594
>>> pi_seq1(100)
3.1514934010709914
>>> pi_seq1(1000)
3.1425916543395442
>>> pi_seq1(10000)
3.1416926435905346
```

5.2 Second Sequence

Another way of computing the value of π is by using the three following sequences:

$$\begin{aligned} A_{n+1} &= \frac{A_n+B_n}{2} \\ B_{n+1} &= \sqrt{A_n * B_n} \\ C_{n+1} &= C_n - 2^n(A_n - A_{n+1})^2 \end{aligned}$$

With the initial values:

$$\begin{aligned} A_0 &= 1 \\ B_0 &= \sqrt{\tfrac{1}{2}} \\ C_0 &= \tfrac{1}{4} \end{aligned}$$

The Brent-Salamin formula gives the value of π as a function of the three previous series for $n \to \infty$ as:

$$\pi = \lim_{n\to\infty} \frac{(A_n + B_n)^2}{4C_n}$$

Write a function `pi_seq2(n: int) -> float` that computes the value of π using the formula above.

Remark: To be able to use the square root function you need to add the following line **at the beginning of your file**:

```
from math import sqrt
```

Remark: You need to compute the three sequences at once in the same loop.

Example

```
>>> pi_seq2(1)
3.1405792505221686
>>> pi_seq2(10)
3.141592653589794
>>> pi_seq2(100)
3.141592653589794
>>> pi_seq2(1000)
3.141592653589794
```

5.3 Comparison

Compare the values obtained by `pi_seq` and `pi_seq2` for the same values of `n`. Also compare it to the more precise value $\pi \approx 3.1415926536$ rounded at the tenth digit.
