► Rate-of-change of fluid vol: $\vec{u}(\vec{r} + d\vec{r}) = \vec{u}(\vec{r}) + \nabla \vec{u} d\vec{r} + O(||d\vec{r}||^2)$

► Rate-of-change of fluid vol: $\vec{u}(\vec{r} + d\vec{r}) = \vec{u}(\vec{r}) + \nabla \vec{u} d\vec{r} + O(||d\vec{r}||^2)$

$$\nabla \vec{u} = \underbrace{\frac{1}{3} (\nabla \cdot \vec{u}) \vec{l}}_{\text{volume}} + \underbrace{\left[\frac{1}{2} (\nabla \vec{u} + \nabla \vec{u}^{T}) - \frac{1}{3} (\nabla \cdot \vec{u}) \vec{l}\right]}_{\text{shear}} + \underbrace{\frac{1}{2} (\nabla \vec{u} - \nabla \vec{u}^{T})}_{\text{rotation}}$$

• Stress Tensor:
$$\vec{\sigma} = \vec{\sigma}_p + \vec{\tau}$$

(Isotropic newtonian fluid)

▲ロト ▲冊 ト ▲ ヨ ト ▲ ヨ ト ● ○ ○ ○ ○

Elastic Stress Tensor:

$$\vec{\sigma}_p = -\frac{1}{3}trace(\vec{\sigma})\vec{l} = -p\vec{l}$$

Viscous Stress Tensor:

Stokes hypothesis

$$\vec{\tau} = \overbrace{\zeta(\nabla \cdot \vec{u})\vec{l}}^{\uparrow} + 2\mu \left(\frac{1}{2}\left(\nabla \vec{u} + \nabla \vec{u}^{T}\right) - \frac{1}{3}\left(\nabla \cdot \vec{u}\right)\vec{l}\right)$$

0

- Transverse velocity gradient:
 - shear stress:

$$\tau = \mu \frac{\partial u}{\partial y}$$

- Newton's law of friction
- Generalises to Stokes' law of friction
- Viscosity:
 - physical property of the fluid
 - strongly dependent on T.
 - friction between adjacent fluid layers
 - μ : dynamic viscosity. [Pas]
 - $\nu = \mu / \rho$: kinematic viscosity. $[m^2/s]$

- Viscous Regimes:
 - Newtonian
 - Non-Newtonian

- Friction Drag
 - shear stress at walls
- Viscous Blockage
 - Pressure Drag (wake)
 - massflow reduction
 - Potential for Separation
 - momentum reduction
- Lift Production
 - due to vorticity generation⁽¹⁾

$$rac{dec{\omega}}{dt} = (ec{\omega}\cdot
abla)ec{u} +
u
abla^2ec{\omega}$$

- Potential for Turbulent Regime
 - increased friction
 - separation delayed

$$(1) \quad \frac{d\vec{\omega}}{dt} = \frac{\partial\vec{\omega}}{\partial t} + (\vec{u}\cdot\nabla)\vec{\omega} = (\vec{\omega}\cdot\nabla)\vec{u} - \vec{\omega}(\nabla\cdot\vec{u}) + \frac{\nabla\rho\times\nabla\rho}{\rho^2} + \nabla\times\left(\frac{\nabla\cdot\vec{\tau}}{\rho}\right) + \nabla\times\vec{\tau}$$

Viscous Effects (Airfoil)

- \blacktriangleright Boundary layer \longrightarrow LIFT and FRICTION DRAG
 - Laminar
 - Turbulent
- $\blacktriangleright \text{ Wake} \longrightarrow \text{FORM DRAG}$

Turbulence

Laminar Flow:

Orderly motion of fluid particles

Turbulent Flow:

- Disorderly motion (deterministic chaos)
- Origin: Instability of the laminar flow
- ► Factors:
 - High Reynolds Number
 - Adverse pressure gradients
 - Wall roughness
 - Preturbulence in outer flow
 - Secondary flows
- Consequences:
 - 3D non-stationary flow
 - Efficient Mixing
 - Homogeneisation of properties
 - Increased wall fricition

Separation

- ► 2D Flow:
 - Adverse pressure gradient
 - Wall friction cancels
 - Recirculated flow
- ▶ 3D Flow (e.g. swept wing):
 - Wall friction needs not cancel
 - Flow may not recirculate
 - Vortical structure formation

Turbulence-Delayed Separation

Laminar Boundary Layer:

- Low friction, but
- Little momentum
 - cannot resist strong adverse pressure gradients
 - early separation: high form drag

Turbulent Boundary Layer

- Higher friction, but
- Increased momentum due to mixing
 - better resistance to adverse pressure gradients
 - delayed separation: smaller form drag

$${
m Re}=2,5,6 imes10^4$$

Flow Around a Streamlined Body

Laminar BL:

- Low friction
- Turbulent BL:

Flow Around a Sphere

Subcritical Regime:

- ► Laminar BL
- ▶ Low friction / big wake

Supercritical Regime:

- Turbulent BL
- Higher friction / smaller wake

Flow Around a Cylinder

Even Greater Complexity (at low Re)

- Intermediate Laminar Regimes
- Symmetry Disruption
- Space-time Symmetries

Airfoil Drag Coefficient

What about airfoils?

Low α :

- \blacktriangleright ~ Streamlined Body
- keep laminar BL

Large α :

- \blacktriangleright ~ Cylinder
- better turbulent BL

Э

Non-Dimensional Navier-Stokes Equations

Equations in non-dimensional form:

- Mass Conservation: $\partial_t \rho + \nabla \cdot (\rho \vec{u}) = 0$
- Momentum Conservation:

$$\rho \,\partial_t \vec{u} + \rho \left(\vec{u} \cdot \nabla \right) \vec{u} = \frac{-1}{\gamma M^2} \nabla p + \frac{1}{Re} \nabla \cdot \vec{\tau} + \frac{\rho}{Fr^2} \frac{\vec{f}}{f}$$

Energy Conservation:

$$\rho \partial_t e + \rho \nabla e \cdot \vec{u} = -(\gamma - 1) p (\nabla \cdot \vec{u}) + \frac{\gamma}{Pr Re} \nabla \cdot (\lambda_c \nabla T) + \gamma (\gamma - 1) M^2 \left(\Theta + \frac{1}{Re} \Phi_D\right)$$

Shear Stress Tensor: $\vec{\tau} = \mu \left(\left(\nabla \vec{u} + \nabla \vec{u}^T\right) - \frac{2}{3} \left(\nabla \cdot \vec{u}\right) \vec{\vec{l}} \right); \ \Phi_D = \frac{1}{2\mu} \vec{\tau}^2$

Non-Dimensional Groupings:

- $M = \frac{u_r}{\sqrt{\gamma p_r/\rho_r}}$: Mach Number
- $Re = \frac{\rho_r u_r l_r}{\mu_r}$: Reynolds Number
- $Fr = \frac{u_r}{\sqrt{fI}}$: Froude Number

- $Pr = \frac{\mu_r C_p}{\lambda_r}$: Prandtl Number
- $\Theta = \frac{\phi_{\tau} I_r}{u_r^3}$: Non-dimensional external heat production

イロト イロト イモト イモト 三日

Properties of High-Reynolds number flows

Navier-Stokes Equations:

- Nonlinear equations, 2nd Order space derivatives
- Boundary Conditions: No-Slip at walls.

In Aerodynamics:

- ▶ High speed flow / low viscosity fluid: $\textit{Re} \longrightarrow \infty$
- Consequences:
 - Euler Equations (1st Order)
 - Further Simplification (incompressibility) leads to Bernoulli Equation
 - ► Barotropic fluid / homentropic flow + conservative body force:
 - \blacktriangleright Irrotational Flow \longrightarrow Scalar Potential for velocity
 - Potential flows:
 - Incompressible flow
 - Compressible Subcritical flow
 - Supercritical and Supersonic flows (attached shock waves), but only approximately

3

イロト 人口 ト イロト

Shortcomings of Potential Flow Theory

Shortcomings:

- ► No-slip boundary conditions not applicable!
- ▶ Irrotational flow: no vorticity \longrightarrow no circulation \longrightarrow no Lift!
- Aerodynamic lift artificially introduced through an arbitrary circulation (Kutta condition)
 - \blacktriangleright Vortex potential: irrotational except at singularity \longrightarrow circulation.
- No aerodynamic drag force predicted in many cases (d'Alembert's paradox for 2D flows) or seriously underestimated.
 - Lift-induced drag in 3D.
- Several observed phenomena cannot be explained or predicted:
 - turbulence
 - wakes
 - detached/separated flow

L. Prandtl (1904): Über Flüssigkeitsbewegungen bei sehr kleiner Reibung (Fluid Flow in Very Little Friction)

In most of the fluid domain:

Inviscid flow remains a valid hypothesis

Close to walls:

 Recover the no-slip boundary condition by considering the effects of viscosity.

Mechanisms for Momentum Transport

Advection:

- Transport along streamlines
- Characteristic Time: $t_a \sim \frac{L}{U}$ Diffusion
 - Transport across streamlines
 - Interaction at the molecular level through viscosity
 - Characteristic Time: $t_v \sim \frac{\delta^2}{\nu}$

Comparison: $\frac{t_v}{t_a} \sim \left(\frac{\delta}{L}\right)^2 Re_L$

Viscosity affects a thin layer such that $t_v \sim t_a$ (BL Hypothesis):

$$\delta^* = \frac{\delta}{L} \sim \frac{1}{\sqrt{Re_L}}$$

Dimensional Analysis

Nondimensionalising with L and U (ρ and μ constants)^(*):

► Continuity:

$$\frac{\partial u^*}{\partial x^*}_{O(1)} + \frac{\partial v^*}{\partial y^*} = 0 \longrightarrow v^* \sim \delta^*$$

► x-momentum:

$$\underbrace{\frac{\partial u^*}{\partial t^*}}_{O(1)} + \underbrace{u^* \frac{\partial u^*}{\partial x^*}}_{O(1)} + \underbrace{v^* \frac{\partial u^*}{\partial y^*}}_{O(\delta^* \cdot \frac{1}{\delta^*})} = -\underbrace{\frac{\partial p^*}{\partial x^*}}_{O(1)} + \underbrace{\frac{1}{Re_L}}_{O(\delta^{*2})} \left[\underbrace{\frac{\partial^2 u^*}{\partial x^{*2}}}_{O(1)} + \underbrace{\frac{\partial^2 u^*}{\partial y^{*2}}}_{O(\frac{1}{\delta^*})} \right]$$

y-momentum:

$$\underbrace{\frac{\partial v^*}{\partial t^*}}_{O(\delta^*)} + \underbrace{u^* \frac{\partial v^*}{\partial x^*}}_{O(\delta^*)} + \underbrace{v^* \frac{\partial v^*}{\partial y^*}}_{O(\delta^* \cdot \frac{\delta^*}{\delta^*})} = -\underbrace{\frac{\partial p^*}{\partial y^*}}_{O(\frac{1}{\delta^*})} + \underbrace{\frac{1}{Re_L}}_{O(\delta^{*2})} \left[\underbrace{\frac{\partial^2 v^*}{\partial x^{*2}}}_{O(\delta^*)} + \underbrace{\frac{\partial^2 v^*}{\partial y^{*2}}}_{O(\frac{1}{\delta^*})}\right]$$

(*)Similar analyses hold for compressible flow and for variable viscosity

イロト イポト イヨト イヨト

2D Boundary Layer Equations

For Stationary, incompressible flow:

Continuity:

$$\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} = 0$$

► y-momentum^(*):

$$\frac{\partial p}{\partial y} = 0$$

x-momentum:

$$\rho u \frac{\partial u}{\partial x} + \rho v \frac{\partial u}{\partial y} = -\frac{dp}{dx} + \frac{\partial}{\partial y} \left(\mu \frac{\partial u}{\partial y} \right)$$

(*) Assuming small curvature: $\delta << R(x) = 1/\kappa(x)$

NS: elliptic equations; BL: parabolic equations: ve cannot be imposed!

With boundary conditions:

- Wall: u(x,0) = v(x,0) = 0
- ▶ B.L. edge: $u(x,\infty) \longrightarrow u_e(x)$

$$\rho_e u_e \frac{du_e}{dx} = -\frac{dp}{dx}$$

• On $x = x_0$: $u(x_0, y) = u_0(y)$

イロト イポト イヨト イヨト

Boundary Layer Characteristic Properties

► Wall Shear Stress:

$$\tau_{\mathsf{w}} = \mu \left(\frac{\partial u}{\partial \mathsf{y}}\right)_{\mathsf{w}}$$

Skin Friction Coefficient:

$$C_f = \frac{\tau_w}{\frac{1}{2}\rho_e u_e^2}$$

Displacement Thickness:

$$\delta_1 = \int_0^\delta \left(1 - \frac{\rho u}{\rho_e u_e} \right) dy$$

Momentum Thickness:

$$\delta_2 = \theta = \int_0^\delta \frac{\rho u}{\rho_e u_e} \left(1 - \frac{u}{u_e}\right) dy$$

► Form Factor:

$$H = \frac{\delta_1}{\theta}$$

Boundary Layer Integral Equations

Integration with respect to y yields 1-dimensional equations:

$$\int_0^{\delta} [Eq] \, dy$$

► Continuity:

$$\frac{1}{u_e}\frac{d}{dx}\left(u_e\left(\delta-\delta_1\right)\right)=\frac{d\delta}{dx}-\frac{v_\delta}{u_e}=C_E$$

Momentum:

$$\frac{d\theta}{dx} + \theta \left(\frac{H+2}{u_e}\frac{du_e}{dx}\right) = \frac{C_f}{2}$$

 $\exists \mapsto$

Solution Methods

- Solve the Navier-Stokes Equations with no assumptions
- ▶ Exploit that *Re_L* >> 1
 - Inviscid Flow Boundary Layer Coupling
 - 1 Solve Euler Equations around airfoil $\longrightarrow p(x)$
 - 2 Solve Boundary Layer Equations $\longrightarrow u, v(x, y) \longrightarrow \delta_1(x), \tau_w(x)$
 - 3 Solve Euler Equations around modified airfoil and wake \rightarrow new p(x)

- Airfoil Performance Calculations:
 - Lift: integration of p(x) from step 3
 - Form Drag: integration of p(x) from step 3
 - Friction Drag: integration of $\tau_w(x)$ from step 2
- Options for step 2:
 - Numerical solution of the local equations
 - Self-Similar Solutions (Falkner-Skan)
 - Integral Methods (approximate)

Wedge Flows:

- Complex Potential: $F(z) = \frac{k}{m+1} z^{m+1}$
 - $\psi(r,\theta) = \operatorname{Im}[F] = \frac{k}{m+1}r^{m+1}\sin((m+1)\theta)$
- Complex Velocity: $w^*(z) = \frac{dF}{dz} = kz^m$

•
$$u_r(r,\theta) = \frac{1}{r} \frac{d\psi}{d\theta} = kr^m \cos((m+1)\theta)$$

- Streamlines through origin: $\theta_w = \frac{n\pi}{m+1}$
 - interpret as walls: $u_r(r, \theta_w) = kr^m (-1)^n$

• Wall velocity:
$$u_e(x) = kx^m$$

Deflection Angle:

$$\alpha = \frac{\pi\beta}{2} \qquad \beta = \frac{2m}{m+1}$$

Cases:

- decelerated flow: $-0.5 \le m < 0$
- flate plate: m = 0
- accelerated flow: $0 \le m < 1$
- stagnation point: m = 1

Non-dimensional self-similar variables:

$$rac{u}{u_e} = f'(\eta)$$
 $\xi = x$ and $\eta = rac{y}{g(x)}$

With the scaling:

$$g(x) = \sqrt{\frac{2}{m+1} \frac{\nu x}{u_e}} \sim \delta(x)$$

The Boundary Layer equations read:

$$f^{\prime\prime\prime} + f f^{\prime\prime} + \beta \left(1 - f^{\prime 2}\right) = 0$$

with boundary conditions:

$$f(0) = f'(0) = 0, \qquad f'(\infty) = 1$$

► Wall Friction Factor:

$$\frac{\tau_w}{\rho_e u_e^2} \sqrt{\frac{u_e x}{\nu}} = \frac{C_f}{2} \sqrt{Re_x} = f''(0) \sqrt{\frac{m+1}{2}}$$

Displacement Thickness:

$$rac{\delta_1}{x}\sqrt{Re_x} = l_1\sqrt{rac{2}{m+1}}$$
 with $l_1 = \int_0^\infty (1-f')d\eta$

Momentum Thickness:

$$rac{ heta}{x}\sqrt{ extsf{Re}_{x}}=l_{2}\sqrt{rac{2}{m+1}}\qquad extsf{with}\qquad l_{2}=\int_{0}^{\infty}f'(1-f')d\eta$$

► Form Factor:

$$H=\frac{I_1}{I_2}$$

- ► Sep: Separation

$$Re_x = \frac{u_e x}{\nu}$$
 $Re_{\delta_1} = \frac{u_e \delta_1}{\nu}$ $Re_{\theta} = \frac{u_e \theta}{\nu}$

イロト イロト イヨト イヨト

Two Useful Cases

Flat Plate Boundary Layer (Blasius)

Wall Friction Factor:

 $\tau_w = 0.332 \, \rho_e u_e^2 \, Re_x^{-1/2}$

Displacement Thickness:

 $\delta_1/x = 1.7208 Re_x^{-1/2}$

Momentum Thickness:

 $\theta/x = 0.664 Re_x^{-1/2}$

- Form Factor: H = 2.591
- Friction force: $F/b = \rho_e u_e^2 \theta(L)$

2D Stagnation Point ($u_e = kx$)

Wall Friction Factor:

$$au_{w}=1.2326\,
ho_{e}\,k\!x\,\sqrt{k
u}$$

Displacement Thickness:

$$\delta_1 = 0.6479 \sqrt{
u/k}$$

Momentum Thickness:

$$heta=0.2923\,\sqrt{
u/k}$$

イロト 不得 トイヨト イヨト

- Form Factor: H = 2.2162
- $\tau_w = 0$ at stagnation point

Open Problem:

▶ 1 equation:

$$\frac{d\theta}{dx} + \theta\left(\frac{H+2}{u_e}\frac{du_e}{dx}\right) = \frac{C_f}{2}$$

▶ 3 unknowns: θ , H and C_f

Closure: Assume Flat Plate laws hold (approximate)

Assumptions:

$$\frac{C_f}{2}Re_\theta = b = 0.2205 \qquad \text{and} \qquad H = 2.591$$

Approximate equation:

$$\frac{d\theta}{dx} + \theta \left(\frac{H+2}{u_e}\frac{du_e}{dx}\right) = \frac{b\nu}{u_e\theta}$$

Solution:

$$\left[\theta u_{e}^{(H+2)}\right]_{x_{1}}^{2} = \left[\theta u_{e}^{(H+2)}\right]_{x_{0}}^{2} + 2b \int_{x_{0}}^{x_{1}} \frac{u_{e}^{2(H+2)}}{u_{e}/\nu} dx$$

Alternative closure:

Pohlhausen's polynomial approximation (4th order):

$$rac{u}{u_e}\equiv f(\eta)$$
 with $\eta=rac{y}{\delta}$

- ▶ BC at η = 0: f(0) = 0
- BC at η = 1: f(1) = 1 and f'(1) = 0
- Analyticity across $\eta = 1$: $f''(1) = f'''(1) = f^{iv}(1) = 0$ From BL equation at $\eta = 0$: $f''(0) = -\frac{\delta^2}{\nu} \frac{du_e}{dx} \equiv -\Lambda$
- From BL' equation at $\eta = 0$: f'''(0) = 0

$$f(\eta) = 2\eta - 2\eta^3 + \eta^4 + \frac{1}{6}\Lambda\eta (1 - \eta)^3$$

Cases:

- $\Lambda = 0$: Flat plate boundary layer.
- $\Lambda = 12$: First overshooting velocity profile.
- $\Lambda = -12$: Separation profile.

Using this profile:

$$\begin{aligned} & \leftarrow \frac{C_f}{2} = \frac{\nu}{u_e\delta} \left(2 + \frac{1}{6}\Lambda \right) \\ & \leftarrow \delta_1 = \delta \left(\frac{3}{10} - \frac{1}{120}\Lambda \right) \\ & \leftarrow \theta = \frac{\delta}{315} \left(37 - \frac{1}{3}\Lambda - \frac{5}{144}\Lambda^2 \right) \end{aligned}$$

Substitute in momentum integral equation and solve for Λ:

$$\frac{d\Lambda}{dx} = \frac{1}{u_e} \frac{du_e}{dx} \frac{-90720 - 10512\Lambda + 282\Lambda^2 - 10\Lambda^3}{-5328 + 48\Lambda + 5\Lambda^2} + \frac{\frac{d^2u_e}{dx^2}}{\frac{du_e}{dx}} \frac{\Lambda^2}{2}$$

- Method:
 - Pick $\frac{du_e}{dx}$ from inviscid calculation.
 - Choose initial value for δ (or θ).
 - Integrate to find evolution of Λ.
 - Obtain the boundary layer thickness δ .

Alternative closure:

- Thwaites' correlation method
 - exploit correlation of analytical and experimental results.

•
$$H = H(\lambda)$$
 and $\frac{C_f}{2}Re_{\theta} \equiv I = I(\lambda)$
• with $\lambda = \frac{\theta^2}{\nu}\frac{du_e}{dx}$, a nondimensional pressure gradient parameter

The momentum integral equation becomes:

$$\frac{u_e}{\nu}\frac{d\theta^2}{dx} = 2\left[I(\lambda) - \lambda\left(H(\lambda) + 2\right)\right] \equiv F(\lambda) \approx 0.45 - 6.0\lambda$$

▶ resulting, after integration, in [Cebeci & Bradshaw]

$$\begin{aligned} \frac{\theta^2 u_e^6}{\nu} &= 0.45 \int_0^x u_e^5 dx + \left(\frac{\theta^2 u_e^6}{\nu}\right)_0 \\ I &= \begin{cases} 0.22 + 1.57\lambda - 1.80\lambda^2 & \text{for } 0 < \lambda < 0.1 \\ 0.22 + 1.402\lambda + 0.018 \frac{\lambda}{\lambda + 0.107} & \text{for } -0.1 < \lambda < 0 \end{cases} \\ H &= \begin{cases} 2.61 - 3.75\lambda + 5.24\lambda^2 & \text{for } 0 < \lambda < 0.1 \\ 2.088 + \frac{0.0731}{\lambda + 0.14} & \text{for } -0.1 < \lambda < 0 \end{cases} \end{aligned}$$

Boundary Layer Laminar-Turbulent Transition

Typical Transition Scenario:

- Laminar flow over a short distance
- Instability to small perturbations
 - Tollmien-Schlichting waves
- Linear growth of waves
- Nonlinear saturation
- Turbulence

Factors & Properties of Turbulent Flow

Factors influencing transition:

- Reynolds number
- External perturbations:
 - Preturbulence levels
 - wall roughness
- Pressure gradient (2D)
- Transverse flow (3D)
- Wall suction
- Others: compressibility, wall curvature, heat transfer...

Transition prediction:

- No general method
 - Different Criteria

Properties of Turbulent Flow:

- High Reynolds numbers
- Mixing capabilities
 - better than viscous diffusion
 - homogeneisation
- faster BL thickness growth
- ► Flow is intrinsically 3D
- Flow is intrinsically time-dependent
- High energy dissipation
- Navier-Stokes hold (turbulent scales >> mollecular scales)

Deterministic chaos

Methods for Solving Turbulent Flows

- Direct Navier Stokes (DNS)
- Reynolds Averaging (RANS)
 - Solve transport equation for mean flow
 - All turbulent scales are modeled
- Filtering (LES)
 - Solve transport equation for resolvable scales
 - Large turbulent scales (large eddies) are solved
 - Small turbulent scales are modeled

Reynolds Averaged Navier Stokes (RANS)

Decompose field f in the sum of an average \overline{f} (filtering or ensemble averaging) plus a fluctuation f'

$$f = \overline{f} + f$$

with

$$\overline{f} = rac{1}{\Delta t} \int_t^{t+\Delta t} f \ dt \qquad ext{or} \qquad \overline{f} = \lim_{N o \infty} rac{1}{N} \sum_{i=0}^N f_i \qquad ext{and} \qquad \overline{f'} = 0$$

Some averaging properties (f, g turbulent and α non-turbulent fields):

$$\overline{f + g} = \overline{f} + \overline{g} \qquad \qquad \overline{\partial f} = \frac{\partial \overline{f}}{\partial t} = \frac{\partial \overline{f}}{\partial t} \\
\overline{f g} = \overline{f} \overline{g} + \overline{f'g'} \qquad \qquad \overline{\partial f} = \frac{\partial \overline{f}}{\partial t} \\
\overline{\partial f} = \alpha \overline{f} \qquad \qquad \overline{\partial f} = \frac{\partial \overline{f}}{\partial x_i} = \frac{\partial \overline{f}}{\partial x_i}$$

For compressible flows: (density-weighted) Favre averaging

$$\widetilde{f} = \overline{\rho f}/\overline{\rho}$$
 and $f' = f - \widetilde{f}$

Reynolds Averaged Navier Stokes (RANS)

Mass Conservation:

$$\frac{\partial \overline{u_j}}{\partial x_j} = 0$$

Momentum Conservation:

$$\rho \frac{\partial \overline{u_i}}{\partial t} + \rho \overline{u_j} \frac{\partial \overline{u_i}}{\partial x_j} = -\frac{\partial \overline{p}}{\partial x_i} + \frac{\partial}{\partial x_j} \left(\mu \frac{\partial \overline{u_i}}{\partial x_j} - \rho \overline{u_i' u_j'} \right)$$

Turbulent Fluctuations Kinetic Energy Equation:

Reynolds Averaged Navier Stokes (RANS)

Open Problem:

- 4 equations:
 - mass
 - momentum (3)
- 10 unknowns:
 - ► p
 - ► $\overline{u_i}$ (\overline{u} , \overline{v} , \overline{w})
 - 6 Reynolds stresses: $\rho \overline{u'_i u'_j}$

$$\vec{\vec{\tau}}_t = -\rho \overline{u'_i u'_j} =$$

$$= -\rho \left(\frac{\overline{u'^2}}{\overline{u'v'}}, \frac{\overline{u'v'}}{\overline{v'2}}, \frac{\overline{u'w'}}{\overline{v'w'}} \right)$$

Closure:

- Reynolds Stress Model
- Turbulent Viscosity Models:

$$-\overline{u_i'u_j'} \equiv \nu_t \left(\frac{\partial \overline{u_i}}{\partial x_j} + \frac{\partial \overline{u_j}}{\partial x_i}\right) - \frac{2}{3}k\delta_{ij}$$

- Algebraic:
 - Mixing length (Baldwin-Lomax, Cebeci-Smith...)
- 1 transport equation models:
 - Prandtl's one-equation
 - Spallart-Almaras
 - Baldwin-Barth
- 2 transport equations models:
 - ► k- ϵ : Std, RNG, Realizable: $\nu_t = C_\mu \frac{k^2}{\epsilon}$

IIPC

• k-
$$\omega$$
: Std, SST ($\omega \sim \epsilon/k$): $\nu_t = \gamma \frac{1}{2}$

- Nonlinear Eddy Viscosity Models:
 - Explicit nonlinear contitutive relation
 - ► v2-f models $(\overline{v^2} f, \zeta f)$

Alternatives to RANS

Scale Resolving Simulations (SRS): Small scale filtering

- ► Approach:
 - Solve large turbulent scales
 - Model small turbulent scales
- Methods:
 - Large Eddy Simulation (LES)
 - Hybrid RANS-LES Models
 - Dettached Eddy Simulation (DES)
 - Scale Adaptive Simulation (SAS)

2D Turbulent Boundary Layer Equations

For 2D, Stationary, incompressible flow:

► Continuity:

$$\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} = 0$$

► y-momentum^(*):

$$\frac{\partial p}{\partial y} = 0$$

x-momentum:

 $\rho u \frac{\partial u}{\partial x} + \rho v \frac{\partial u}{\partial y} = -\frac{dp}{dx} + \frac{\partial}{\partial y} \left(\mu \frac{\partial u}{\partial y} - \rho \overline{u'v'} \right)$

(*) Assuming small curvature: $\delta << R(x) = 1/\kappa(x)$

NS: elliptical equations; BL: parabolic equations: ve cannot be imposed!

With boundary conditions:

- Wall: $u = v = \overline{u'v'} = 0$
- B.L. edge: $u \rightarrow u_e$ and $\overline{u'v'} \rightarrow 0$

 $\rho_e u_e \frac{du_e}{dx} = -\frac{dp}{dx}$

• On $x = x_0$: laminar BL results Assuming $\overline{u'w'} = \overline{v'w'} = 0$

イロト イポト イヨト イヨト

Turbulent BL Solution Methods

- Solve Local Equations
 - Needs turbulent model for closure
- Self-Similar Solutions
 - Universal profile close to the wall (viscous sublayer)
 - Self-similar log-law in most of the boundary layer
- Integral Methods
 - Integral equations formally identical to laminar case
 - Experimental input is needed

Experimental Results for the Flat Plate Boundary Layer:

- $\blacktriangleright~H \rightarrow 1$ as $\textit{Re} \rightarrow \infty~(H \sim 1.3, 1.4~\text{for}~\textit{Re} \sim 10^6, 10^7)$
- Empirical law for fricition factor:

$$C_{f} = \frac{0.0368}{Re_{x}^{1/6}} \qquad \frac{\frac{d\theta}{dx} = \frac{C_{f}}{2}}{Re_{x}^{1/6}} \qquad C_{f} = \frac{0.0172}{Re_{\theta}^{1/5}}$$

-

Integral Method (Laminar and Turbulent BL)

Open Problem:

▶ 1 equation:

$$\frac{d\theta}{dx} + \theta\left(\frac{H+2}{u_e}\frac{du_e}{dx}\right) = \frac{C_f}{2}$$

▶ 3 unknowns: θ , H and C_f

Closure: Assume Flat Plate laws hold (approximate)

Assumptions:

$$rac{C_f}{2} = rac{b}{Re_{ heta}^{m_0}} \qquad ext{and} \qquad H ext{ constant}$$

		m_0	b	Н
 with 	laminar	1	0.2205	2.591
	turbulent	1/5	0.0086	1.4

Solution:

$$\left[\theta u_e^{(H+2)}\right]_{x_1}^{m_0+1} = \left[\theta u_e^{(H+2)}\right]_{x_0}^{m_0+1} + (m_0+1)b\int_{x_0}^{x_1} \frac{u_e^{(m_0+1)(H+2)}}{(u_e/\nu)^{m_0}} dx$$

Integral Method (Flow Around Airfoil)

- Set $x_0 = 0$ at the stagnation point
 - ▶ Assume laminar BL at x₀
 - Use Falkner-Skan solution (m = 1) to compute $\theta(0)$
- Use laminar integral method from x_0 to x_T
- x_T , the transiton point, is:
 - known or assumed
 - determined with some transition criterion
- Assume continuity of θ at x_T : $\theta_{lam}(x_T) = \theta_{turb}(x_T)$
- Use turbulent integral method beyond x_T

Integral Method (Results For Flat Plate)

Assuming the BL starts directly at the leading edge:

$$p = \frac{k_1}{Re_x^{s_0}} \qquad p = \frac{k_2}{Re_\theta^{m_0}}$$

	Lam	inar	Turbulent			
	m_0	= 1	$m_0 = 1/5$			
	$s_0 =$	1/2	$s_0 = 1/6$			
р	k_1	k ₂	k_1	k ₂		
θ/x	0.664	0.441	0.0221	0.0103		
δ_1/x	1.721 1.143		0.0309	0.0144		
C _f	0.664	0.441	0.0368	0.0172		

Relations for turbulent flows:

$$\begin{array}{lll} H &=& 1.4 \\ C_{f} &=& \frac{0.0368}{Re_{x}^{1/6}} \end{array} \end{array} \end{array} \xrightarrow{\begin{array}{lll} \frac{d\theta}{dx} = \frac{C_{f}}{2}}{2} \xrightarrow{\theta} \frac{\theta}{x} (Re_{x}) \longrightarrow \left\{ \begin{array}{c} \frac{\theta}{x} (Re_{\theta}) \\ C_{f} (Re_{\theta}) \end{array} \right\} \xrightarrow{\begin{array}{lll} \delta_{1} = \theta H \\ C_{f} (Re_{\theta}) \end{array}} \left\{ \begin{array}{c} \frac{\delta_{1}}{x} (Re_{x}) \\ \frac{\delta_{1}}{x} (Re_{\theta}) \end{array} \right\} \xrightarrow{\begin{array}{lll} 0.0368 \\ \frac{\delta_{1}}{x} (Re_{\theta}) \end{array}$$

Turbulent BL Structure

- fluctuation velocities self-correlation $\overline{u_i'^2}$
 - $\overline{u_i^{\prime 2}} = 0$ at the wall
 - Rapid increase to a maximum
 - Slow decrease to outer flow levels
 - $\bullet \ \overline{u'^2} > \overline{w'^2} > \overline{v'^2}$
- friction stress $\tau = \mu \frac{\partial u}{\partial v} \rho \overline{u'v'}$
 - Viscous Sublayer: $\mu \frac{\partial u}{\partial v}$ dominates
 - Log layer: $-\rho \overline{u'v'}$ dominates
- velocity and length scales:
 - Shear (or friction) velocity and length:

$$u_{ au} = \sqrt{rac{ au_w}{
ho}} \qquad l_{ au} = rac{
u}{u_{ au}}$$

Wall variables:

$$u^+ = rac{u}{u_ au} \qquad y^+ = rac{y \ u_ au}{
u}$$

Prandtl (1925): A fluid particle with mean longitudinal velocity u(y), and transversally displaced by the transversal veocity fluctuation v' retains its momentum over a length *I*. The longitudinal velocity fluctuation is then $u' = u(y + I) - u(y) \simeq I \frac{\partial u}{\partial v}$. We then assume $v' \simeq -u'$

Model for Reynold-Stresses:

$$-\overline{u'v'} = F^2 l^2 \left(\frac{\partial u}{\partial y}\right)^2$$

Experimental Mixing Length:

Ι	— 0.085 taph	(χ	У∖
$\overline{\delta}$	= 0.005 tann	10).085	$\overline{\delta}$

- $\chi = 0.41$ von Karman constant
- Damping Function:

$$F = 1 - exp\left(-rac{y^+}{A^+}
ight); \ A^+ = 26$$

Prandtl (1925): A fluid particle with mean longitudinal velocity u(y), and transversally displaced by the transversal veocity fluctuation v' retains its momentum over a length *I*. The longitudinal velocity fluctuation is then $u' = u(y + I) - u(y) \simeq I \frac{\partial u}{\partial y}$. We then assume $v' \simeq -u'$

Model for Reynold-Stresses:

$$-\overline{u'v'} = F^2 l^2 \left(\frac{\partial u}{\partial y}\right)^2$$

Experimental Mixing Length:

$$\frac{l}{\delta} = 0.085 \tanh\left(\frac{\chi}{0.085} \frac{y}{\delta}\right)$$

- $\chi = 0.41$ von Karman constant
- Damping Function:

$$F = 1 - exp\left(-rac{y^+}{A^+}
ight); \ A^+ = 26$$

Universal Turbulent BL Profile

Turbulent BL Inner Region

Near wall hypothesis:

$$t_a >> t_d: \ \frac{\partial \tau}{\partial y} = 0 \longrightarrow \frac{\tau}{\tau_w} = 1$$
$$t = \chi y$$

► Equations:

$$\begin{split} \tau &= \mu \frac{\partial u}{\partial y} + \rho F^2 l^2 \left(\frac{\partial u}{\partial y} \right)^2 = \tau_w \\ \frac{\partial u^+}{\partial y^+} + \chi^2 y^{+2} \left[1 - \exp\left(-\frac{y^+}{A^+} \right) \right]^2 \left(\frac{\partial u^+}{\partial y^+} \right)^2 = 1 \end{split}$$

- ► Solutions:
 - ► Viscous Sublayer (y⁺ < 5): u⁺ = y⁺
 - ▶ Buffer Region (5 < y⁺ < 30)</p>

► Log Law (30 <
$$y^+$$
):
 $u^+ = \frac{1}{\chi} \ln y^+ + C; C \simeq 5.25$

Turbulent BL Outer Region

► Velocity Defect Law:

 $\frac{u_{\mathsf{e}}-u}{u_{\tau}}=-\frac{1}{\chi}\ln\frac{y}{\delta}+D$

région externe (vitesses déficitaires)

Compatibility:

► Turbulent Friction Law: $\left(\frac{C_f}{2}\right)^{-1/2} = \frac{1}{\chi} \ln (Re_{\delta_1}) + D$ ► $D^* = 4.18$ for flat plate

Momentum & Thermal BL

Two Boundary Layers:

- Momentum BL due to velocity profile
- Thermal BL due to temperature profile
 - ► Energy-momentum equations coupling due to variable density:
 - Temperature effects (heating/cooling)
 - Compressibility effects at high Mach number

Compressibility & Thermal Effects

Incompressible BL if:

•
$$M_e = u_e/\sqrt{\gamma r T_e} \lesssim 0.4, 0.5$$

• T_w close to T_e

Otherwise compressible

Transonic & Supersonic BL:

• $T_i \simeq \text{ct}$ for adiabatic walls

► local M, $T_s \neq$ ct $\longrightarrow \mu$, ρ , λ_c change Wall properties:

- Adiabatic: $\Phi_w = 0$
 - recovery factor: $r = \frac{h_{aw} h_e}{h_{ie} h_e}$
 - ▶ laminar: *r* ≃ 0.85
 - turbulent: $r \simeq 0.9$
- Non-adiabatic wall: T_w
 - ► heat flux coeff: $C_h = \frac{\Phi_w}{\rho_e u_e C_p(T_w T_{aw})}$
 - Reynolds analogy factor: $s = \frac{C_h}{C_f/2}$
 - flat plate: s = 1.24
 - ► pressure gradient: big changes
- Energy Thickness:

$$\delta_{3} = \Delta = \int_{0}^{\delta} \frac{\rho u}{\rho_{e} u_{e}} \left(\frac{h_{i}}{h_{ie}} - 1\right) dy$$

2D Compressible BL Equations

Continuity:

$$\frac{\partial \rho}{\partial t} + \frac{\partial (\rho u)}{\partial x} + \frac{\partial (\rho v)}{\partial y} = 0$$

y-momentum:

$$\frac{\partial p}{\partial y} = 0$$

x-momentum:

$$\rho \frac{\partial u}{\partial t} + \rho u \frac{\partial u}{\partial x} + \rho v \frac{\partial u}{\partial y} = -\frac{dp}{dx} + \frac{\partial}{\partial y} \left(\mu \frac{\partial u}{\partial y} \right)$$

Energy:

$$\rho \frac{\partial h_i}{\partial t} + \rho u \frac{\partial h_i}{\partial x} + \rho v \frac{\partial h_i}{\partial y} = \frac{\partial p}{\partial t} + \frac{\partial}{\partial y} \left(\mu u \frac{\partial u}{\partial y} + \lambda_c \frac{\partial T}{\partial y} \right)$$

- Boundary Conditions:
 - ► Wall: u(x,0;t) = v(x,0;t) = 0; $T(x,0;t) = T_w(x;t)$
 - ► Edge: $u(x,\infty;t) \longrightarrow u_e(x;t); T(x,\infty;t) \longrightarrow T_e(x;t)$
- Initial Conditions for t = 0

2D Compressible BL Integral Equations

Integration with respect to y yields 1-dimensional equations:

$$\int_0^{\delta} [Eq] \, dy$$

► Continuity:

$$\frac{1}{\rho_e u_e} \frac{d}{dx} \left(\rho_e u_e \left(\delta - \delta_1 \right) \right) = \frac{d\delta}{dx} - \frac{v_\delta}{u_e} = C_E$$

Momentum:

$$\frac{d\theta}{dx} + \theta \left(\frac{H+2}{u_e} \frac{du_e}{dx} + \frac{1}{\rho_e} \frac{d\rho_e}{dx} \right) = \frac{C_f}{2} \qquad \text{with} \qquad \frac{1}{\rho_e} \frac{d\rho_e}{dx} = -\frac{M_e^2}{u_e} \frac{du_e}{dx}$$

► Energy:

$$\frac{1}{\rho_e u_e} \frac{d}{dx} \left(\rho_e u_e \delta_3 \right) = \frac{\phi_w}{\rho_e u_e h_{ie}}$$

Flat Plate Compressible BL

Recovery enthalpy:

$$h_{aw} = h_e \left(1 + r rac{\gamma - 1}{2} M_e^2
ight)$$

- recovery factor:
 - laminar: $r = Pr^{1/2}$
 - turbulent: $r = Pr^{1/3}$
- ▶ $Pr_{air} = 0.725 \rightarrow 0.711$
- Reynolds analogy factor:

$$C_h = s \frac{C_f}{2}$$
 with $s = Pr^{-2/3} = 1.24$

- Wall enthalpy:
 - ► Adiabatic wall: h_w = h_{aw}
 - Prescribed T_w : $h_w = C_p T_w$
- ► Reference enthalpy:

$$h^{*} = h_{e} + 0.54 \left(h_{w} - h_{e}\right) + 0.16 \left(h_{aw} - h_{e}\right)$$

Wall friction:

$$\frac{C_f}{2} = \frac{a f}{Re_x^{s_0}} = \frac{b g}{Re_\theta^{m_0}}$$

Momentum thickness:

$$\frac{\theta}{x} = \frac{k_1 f}{Re_x^{s_0}} = \frac{k_2 g}{Re_{\theta}^{m_0}}$$

Form Factor:

$$\textit{H} = \textit{H}_{\textit{inc}} + \alpha \textit{M}_{e}^{2} + \beta \, \frac{\textit{T}_{w} - \textit{T}_{\textit{aw}}}{\textit{T}_{e}}$$

Compressible deviations:

$$f = \left(\frac{T_e}{T^*}\right)^{1-s_0} \left(\frac{\mu^*}{\mu_e}\right)^{s_0} \quad g = f^{m_0+1}$$

• Sutherland law: (S = 110.4 K)

$$\frac{\mu^*}{\mu_e} = \left(\frac{T^*}{T_e}\right)^{1/2} \frac{1 + S/T_e}{1 + S/T^*}$$

3-Dimensional Boundary Layer

Some examples of 3D-Flows:

- Swept Wing
- Wing-tip vortices
- Fuselage with aoa

Consequences for BL:

- Secondary flows due to transverse pressure gradients
- Friction lines not parallel to external flow
- Instabilities
- Separation

3-Dimensional Boundary Layer

UP

2D Axisymmetric Boundary Layer Equations

For Stationary, 2D Axisymmetric flow:

► Local Equations:

With:

state equation:
$$\frac{p}{\rho} = rT$$

stagnation enthalpy: $h_i = h + \frac{u^2 + v^2}{2} = h + \frac{u^2}{2}$
shear stress: $\tau = \mu \frac{\partial u}{\partial y} - \rho \overline{u'v'}$
heat flux: $\Phi = -\lambda_c \frac{\partial T}{\partial y} + \rho C_\rho \overline{v'T'}$

(E) < E)</p>

2D Axisymmetric Boundary Layer Equations

For Stationary, 2D Axisymmetric flow:

Integral Equations:

mass:

$$\frac{1}{\rho_e u_e R} \frac{d}{dx} \left(\rho_e u_e R \left(\delta - \delta_1 \right) \right) = \frac{d\delta}{dx} - \frac{v_{\delta}}{u_e} = C_E$$
x-momentum:

$$\frac{d\theta}{dx} + \theta \left(\frac{H+2}{u_e} \frac{du_e}{dx} + \frac{1}{\rho_e} \frac{d\rho_e}{dx} + \frac{1}{R} \frac{dR}{dx} \right) = \frac{C_f}{2}$$
energy:

$$\frac{1}{\rho_e u_e R} \frac{d}{dx} \left(\rho_e u_e R \delta_3 \right) = \frac{\phi_w}{\rho_e u_e h_{ie}}$$

► With:

isentropic outer flow:
$$\frac{1}{\rho_e} \frac{d\rho_e}{dx} = -\frac{M_e^2}{u_e} \frac{du_e}{dx}$$

Incompressible 2D Axisymmetric Integral Method

Approximate Solution:

$$\left[\theta R u_e^{(H+2)}\right]_{x_1}^{m_0+1} = \left[\theta R u_e^{(H+2)}\right]_{x_0}^{m_0+1} + (m_0+1)b \int_{x_0}^{x_1} \frac{u_e^{(m_0+1)(H+2)} R^{(m_0+1)}}{(u_e/\nu)^{m_0}} dx^{(m_0+1)(H+2)} R^{(m_0+1)} dx^{(m_0+1)(H+2)} dx^{(m_0+1)(H+2)$$

Laminar-Turbulent Transition

Predicting transition is crucial to drag estimation

- Natural Transition:
 - Orr-Sommerfeld equations (linearised Navier-Stokes)
 - Linear instability: Tollmien-Schlichting waves
 - Secondary instabilities
- Affecting parameters:
 - Adverse pressure gradients
 - Outer flow preturbulent levels and noise
 - Wall-related effects:
 - suction
 - cooling
 - curvature: Görtler vortices
 - rugosity
 - Three-dimensionality:
 - Cross-flow instability (swept wing)
 - Leading edge contamination (fuselage)
- Transition Criteria:
 - ▶ Michele's, Granville, *eⁿ* Method...

Drag Decomposition

Drag Sources:

- Airfoil drag
 - Parasitic drag
 - Friction drag
 - Form drag
 - Wake drag
 - Interference drag
 - Wave drag
- Lift-induced drag
