

Linear momentum

$$\vec{p} \equiv m\vec{v}$$

$$\vec{F} = m\vec{a} = m \frac{d\vec{v}}{dt} = \frac{d(m\vec{v})}{dt} = \frac{d\vec{p}}{dt}$$

Angular momentum

= torque of $\vec{p} \equiv$ moment of \vec{p}

$$\vec{L} \equiv \vec{r} \times \vec{p}$$

$$\frac{d\vec{L}}{dt} = \left(\vec{r} \times \frac{d\vec{p}}{dt} \right) + \left(\frac{d\vec{r}}{dt} \times \vec{p} \right)$$

$$\frac{d\vec{L}}{dt} = \vec{r} \times m\vec{a}$$

= 0 because $\frac{d\vec{r}}{dt} = \vec{v} \Rightarrow$ parallel

$$\frac{d\vec{L}}{dt} = \vec{r} \times \vec{F} \equiv \vec{M} \equiv \vec{\tau} \quad \text{torque of a force}$$

$$\boxed{\vec{\tau} = \frac{d\vec{L}}{dt}}$$

ENERGY AND WORK

Work

$$dW = \vec{F} \cdot d\vec{\ell}$$

$$W = \vec{F} \cdot \vec{\ell}$$

$$1 \text{ Joule} = 1 \cdot \text{Nm}$$

$$1 \text{ eV} = 1.6 \cdot 10^{-19} \text{ Joules}$$

Additive principle $W_T = W_1 + W_2$

$$W_T = \int_{\pi} \vec{F} \cdot d\vec{\ell} \quad \equiv \text{''work done by the vector field } \vec{F} \text{''}$$

Energy

Capacity of bodies to perform a work. -

\equiv 'something' that is observed is conserved \rightarrow
 it is 'stored somehow' and allows to do work. -

$$\Delta W = \int dW = \int F d\ell = \int m \frac{dv}{dt} d\ell = \int m v \frac{dv}{d\ell} d\ell =$$

$$\frac{dv}{d\ell} = \frac{dv}{dt} \cdot \frac{dt}{d\ell} = v \cdot \frac{dt}{d\ell}$$

energy =

Cartagena99

Theorem work-energy

$$\Delta W = \Delta T$$

The work done on a particle is equal to the increase in kinetic energy:-

Power

$$P = \frac{dW}{dt}$$

$$1 \text{ watt} = \frac{1 \text{ Joule}}{\text{sec.}}$$

$$P = \vec{F} \cdot \frac{d\vec{e}}{dt} = \vec{F} \cdot \vec{v}$$

$\downarrow \quad \downarrow$
 $m\vec{a} \quad \vec{v}$

"how fast the energy is released"

Example: work done by weight

$$\begin{aligned} W &= \text{Work} = \vec{w} \cdot \vec{l} \\ W &= mg l \cos \theta \\ &= mg \cos \theta \cdot l \\ &= mg \cos(90 - \phi) \cdot l \\ &= mg \sin \phi \cdot l \\ &= mgh \end{aligned}$$

\sim weight

$$mgh = \frac{1}{2}mv^2$$

- a) $v = \sqrt{2gh}$ does not depend on mass
 b) Work does not depend on $\theta \Rightarrow$
 \Rightarrow does not depend on trajectory
 \Rightarrow conservation of energy ...

Conservative Forces

Mathematical definitions for conservative field

- $\int_A^B \vec{F} \cdot d\vec{l}$ does not depend on trajectory
- $\oint \vec{F} \cdot d\vec{l} = 0$
- $\nabla \times \vec{F} = 0$
- $\exists \phi_p$ such as $\vec{F} = -\nabla \phi_p$

Potential energy

ϕ_p scalar function.

$\phi_p + \text{constant}$ returns the same \vec{F}

$$\Delta \phi_{A \rightarrow B} = \phi_B - \phi_A = - \int_A^B \vec{F} \cdot d\vec{l} = \text{Potential energy}$$

$\Delta \phi_{A \rightarrow B}$ = work done by external agent for moving a mass 'm' from A \rightarrow B

Potential energy for elastic bodies

$$F = -kx$$

Not all forces are conservative.
check Hooke's law forces are conservative.

$$\vec{\nabla} \cdot \vec{F} \stackrel{?}{=} 0$$

if so ... (they are) ...

$$\exists \text{ } \mu \text{ such as } \vec{F} = -\vec{\nabla} \mu$$

$$\Delta \mu_{A \rightarrow B} = - \int_A^B F dx =$$

$$= - \int_{x_A}^{x_B} (-kx) dx = k \left[\frac{x^2}{2} \right]_{x_A}^{x_B}$$

$$\mu_B - \mu_A = k \frac{x_B^2}{2} - k \frac{x_A^2}{2}$$

$$\text{Taking } x_A = 0 \Rightarrow \mu_A = 0$$

$$\mu_B = k \frac{x_B^2}{2} \quad \text{in general} \quad \mu_B = k \frac{x^2}{2}$$

the external agent acts against spring

Energy - work in conservative fields,

In general, theorem energy work $\Delta W = \Delta T$
In conservative fields, work done is $-\Delta U_p$

hence $W = -\Delta U_p$
 $W = \Delta T$

So ... $\Delta T = -\Delta U_p$

$$T_f - T_o = - (U_{pf} - U_{po})$$

$$T_f + U_{pf} = T_o + U_{po}$$

\equiv Mechanical energy $\equiv E_M$

$$E_M = T + U$$

$\Delta E_M = 0$ in conservative fields
