

## Review of Complex Numbers

### C.1 REPRESENTATION OF COMPLEX NUMBERS

The complex number  $z$  can be expressed in several ways.

Cartesian or rectangular form:

$$z = a + jb \quad (C.1)$$

where  $j = \sqrt{-1}$  and  $a$  and  $b$  are real numbers referred to the *real part* and the *imaginary part* of  $z$ .  $a$  and  $b$  are often expressed as

$$a = \text{Re}\{z\} \quad b = \text{Im}\{z\} \quad (C.2)$$

where “Re” denotes the “real part of” and “Im” denotes the “imaginary part of.”

Polar form:

$$z = re^{j\theta} \quad (C.3)$$

where  $r > 0$  is the *magnitude* of  $z$  and  $\theta$  is the *angle* or *phase* of  $z$ . These quantities are often written as

$$r = |z| \quad \theta = \angle z \quad (C.4)$$

Figure C-1 is the graphical representation of  $z$ . Using Euler's formula,

$$e^{j\theta} = \cos \theta + j \sin \theta \quad (C.5)$$

or from Fig. C-1 the relationships between the cartesian and polar representations of  $z$  are

$$a = r \cos \theta \quad b = r \sin \theta \quad (C.6a)$$

$$r = \sqrt{a^2 + b^2} \quad \theta = \tan^{-1} \frac{b}{a} \quad (C.6b)$$

Fig. C-1

## C.2 ADDITION, MULTIPLICATION, AND DIVISION

If  $z_1 = a_1 + jb_1$  and  $z_2 = a_2 + jb_2$ , then

$$z_1 + z_2 = (a_1 + a_2) + j(b_1 + b_2) \quad (C.7)$$

$$z_1 z_2 = (a_1 a_2 - b_1 b_2) + j(a_1 b_2 + b_1 a_2) \quad (C.8)$$

$$\begin{aligned} \frac{z_1}{z_2} &= \frac{a_1 + jb_1}{a_2 + jb_2} = \frac{(a_1 + jb_1)(a_2 - jb_2)}{(a_2 + jb_2)(a_2 - jb_2)} \\ &= \frac{(a_1 a_2 + b_1 b_2) + j(-a_1 b_2 + b_1 a_2)}{a_2^2 + b_2^2} \end{aligned} \quad (C.9)$$

If  $z_1 = r_1 e^{j\theta_1}$  and  $z_2 = r_2 e^{j\theta_2}$ , then

$$z_1 z_2 = (r_1 r_2) e^{j(\theta_1 + \theta_2)} \quad (C.10)$$

$$\frac{z_1}{z_2} = \left( \frac{r_1}{r_2} \right) e^{j(\theta_1 - \theta_2)} \quad (C.11)$$

## C.3 THE COMPLEX CONJUGATE

The *complex conjugate* of  $z$  is denoted by  $z^*$  and is given by

$$z^* = a - jb = r e^{-j\theta} \quad (C.12)$$

Useful relationships:

1.  $z z^* = r^2$
2.  $\frac{z}{z^*} = e^{j2\theta}$
3.  $z + z^* = 2 \operatorname{Re}\{z\}$
4.  $z - z^* = j2 \operatorname{Im}\{z\}$
5.  $(z_1 + z_2)^* = z_1^* + z_2^*$
6.  $(z_1 z_2)^* = z_1^* z_2^*$
7.  $\left( \frac{z_1}{z_2} \right)^* = \frac{z_1^*}{z_2^*}$

## C.4 POWERS AND ROOTS OF COMPLEX NUMBERS

The  $n$ th power of the complex number  $z = r e^{j\theta}$  is

$$z^n = r^n e^{jn\theta} = r^n (\cos n\theta + j \sin n\theta) \quad (C.13)$$

from which we have DeMoivre's relation

$$(\cos \theta + j \sin \theta)^n = \cos n\theta + j \sin n\theta \quad (C.14)$$

The  $n$ th root of a complex  $z$  is the number  $w$  such that

$$w^n = z = re^{j\theta} \quad (C.15)$$

Thus, to find the  $n$ th root of a complex number  $z$  we must solve

$$w^n - re^{j\theta} = 0 \quad (C.16)$$

which is an equation of degree  $n$  and hence has  $n$  roots. These roots are given by

$$w_k = r^{1/n} e^{j[\theta + 2(k-1)\pi]/n} \quad k = 1, 2, \dots, n \quad (C.17)$$
