Universidad Rey Juan Carlos Course 2020-2021

1. A body starts to move upwards on an inclined plane (ramp with angle $\alpha$ ) with initial velocity $v_{0}$. If the friction coefficient is $\mu$, determine the distance covered before stopping. What will be the speed of the body when it returns (if it does) to the base of the plane?
Ans:

$$
s=\frac{v_{0}^{2}}{2(\mu \cos \alpha+\operatorname{sen} \alpha) g} ; v^{2}=v_{0}^{2} \frac{\operatorname{tg} \alpha-\mu}{\operatorname{tg} \alpha+\mu}
$$

2. A sled on the snow carrying two children is pulled by a rope forming an angle of $40^{\circ}$ with respect horizontal. The mass of the two children (together) is 45 kg , and the mass of the sled is 5 kg . The static and kinetic friction coefficients are $\mu_{\mathrm{s}}=0,2$ and $\mu_{\mathrm{k}}=0,15$, respectively. Determine the friction force on the sled and the acceleration of the whole system when the tension of the rope is: a) 100 N, b) 140 N . Ans.: a) $\mathrm{F}_{\mathrm{f}}=$ $76,6 \mathrm{~N}$; at rest; b) $\mathrm{F}_{\mathrm{f}}=60,1 \mathrm{~N} ; \mathrm{a}=0,94 \mathrm{~m} / \mathrm{s}^{2}$.
3. The bodies $A$ and $B$ have equal mass, $m=1 \mathrm{~kg}$, and equal kinetic friction coefficient $\mu$. They are tied together with a rope (negligible mass), and move from left to right at constant speed. Taking $g=9,84 \mathrm{~m} / \mathrm{s} 2$. (a) Calculate the tension of the rope and the friction coefficient $\mu$. (b) If we cut the rope, what is the acceleration of each body? (c) If A stops after $0,61 \mathrm{~s}$ we have cut the rope, what is the distance that B has covered during that time interval? Ans.: a) $5,2 \mathrm{~N}, \mu=0,15$; b) $-5,2 \mathrm{~m} / \mathrm{s}^{2}$ and $5,2 \mathrm{~m} / \mathrm{s}^{2}$; c) $2,9 \mathrm{~m}$

4. The weight of the body of the figure is $88,9 \mathrm{~N}$. The static friction coefficient between the body and the wall is 0,560 . (a) What is the minimum force $F$ required for keeping the body at rest? (b) What is the minimum force F required for moving it upwards? Ans.: a) 78,95 N;
b) $218,97 \mathrm{~N}$
5. The two bodies in the figure are tied together with ropes and pulleys of negligible mass. The friction coefficient for bodies 2 and 3 is 0,2 . The bodies were at rest, but once we pull body 1 with force F , the body 1 goes downwards with an acceleration $\mathrm{a}=1,5$ $\mathrm{m} / \mathrm{s}^{2}$. a) Determine the value of F and tension T . b) If the force F only pulls for 1 s , calculate the speed of the bodies $1,5 \mathrm{~s}$ once after
 the force is not pulling anymore. Ans: a) $\left.\mathrm{F}=90 \mathrm{~N} ; \mathrm{T}_{1-2}=266 \mathrm{~N} ; \mathrm{T}_{2-3}=1825 \mathrm{~N} ; \mathrm{b}\right) \mathrm{v}=0,5 \mathrm{~m} / \mathrm{s}$
6. A bucket containing water rotates in a vertical plane within a circle of Radius 1 m . Mass of water is 2 kg , mass of bucket is negligible. The speed of the bucket in the upper part of the circular trajectory is $v_{a}$. Determine the minimum value of $v_{a}$ for avoiding the water to fall down. Ans: $v_{a}$ min $=3,130 \mathrm{~m} / \mathrm{s}$
7. A particle of mass $m$ is suspended from a rope of length $L$, moving at constant speed $v$, following a horizontal circle of radius $r$. The rope forms an angle $\theta$, with $\operatorname{sen} \theta=\mathrm{r} / \mathrm{L}$. Calculate the tension of the rope and the particle speed. Ans.: $\mathrm{T}=\mathrm{mg} / \cos \theta ; \mathrm{v}^{2}=\mathrm{gr} \operatorname{tg} \theta$
8. A section of a road has a superelevation that allows a car moving at $30 \mathrm{~km} / \mathrm{h}$ turning around a curve with radius 400 m without sliding (friction is neglected). Determine the interval of speeds that allow driving without sliding when the static friction coefficient is 1 . Ans: $\mathrm{v}_{\min }=0 ; \mathrm{v}_{\max }=230 \mathrm{~km} / \mathrm{h}$
9. A mass $m$ hangs from the roof of a car with a rope of length 30 cm . Determine the angle of the rope with the vertical, and the direction of displacement of the rope, when: a) the car moves straight forward with speed $110 \mathrm{~km} / \mathrm{h}$; b) turns around a curve 500 m radius, at $90 \mathrm{~km} / \mathrm{h}$; c) moves at $90 \mathrm{~km} / \mathrm{h}$ straight forward,
