Memory consistency models

- A memory consistency model:
 - ▣ Set of rules defining how the memory system processes memory operations from multiple processors.
 - ▣ Contract between programmer and system.

Cartagena99

Computer Architecture 2014

- Memory behavior model:
 - ▣ Memory operations happen ins program order.
 - A read returns the value from last write in program order.
- Semantics defined by sequential program order.
 - ▣ Simple reasoning but constrained.
 - Solve data and control dependencies.
 - ▣ Independent operations may be executed in parallel.

Cartagena99

CALL OR WHATSAPP:689 45 44 70

Computer Architecture 2014

- Program order.
 - ▣ Memory operations from a program must be made visible to all processes in program order.

- Atomicity.
 - ▣ Total execution order between processes must be consistent requiring all operations to be atomic.
 - Nothing that a processor does after it has seen the new value from a write is made visible to other processes before they have seen the value from that

Computer Architecture 2014

- SC constraints all memory operations:
 - ▣ Write → Read.
 - ▣ Write → Write.
 - ▣ Read → Read, Read → Write.
- Simple model to reason about parallel programs.
- But, simple reordering for single-processors may violate the sequential consistency model:
 - ▣ Hardware reordering to improve performance.
 - Write buffers, overlapped writes.
 - ▣ Compiler optimizations apply transformations with memory operations reordering. Scalar replacement, register allocation, instruction scheduling.

Computer Architecture 2014

- Sufficient conditions:
 - Each process emits memory operations in program order.
 - After emission of a write, emitting process waits to complete the write before emitting other operation.
 - After a read emission, emitting process waits until read is completed and that the write of the value being read is completed.
 - Wait write propagation to all processes.
- These are very exigent conditions.

■ There might be necessary conditions that are less

ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS
CALL OR WHATSAPP:689 45 44 70

Computer Architecture 2014

- Weak ordering:
 - ▣ Divide memory operations in data operations and synchronization operations.
 - ▣ Synchronization operations act as a barrier.
 - All preceding data operations in program order to a synchronization must complete before synchronization is executed.
 - All subsequent data operations in program order to a synchronization operation must wait until synchronization is completed.
 - Synchronization are performed in program order.
 - ▣ Hardware implementation of barrier.
 - Processor keeps a counter.
 - Data operation emission → increment.
