ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS
CALL OR WHATSAPP:689 45 44 70

Recursion

- A definition is recursive when it is defining something in terms of the definition itself.
- Example: The factorial function
 - “The factorial of a number is obtained multiplying the number by the factorial of the number minus 1”

$$n! = \begin{cases} n * (n-1)! & \text{If } n > 0 \\ 1 & \text{If } n = 0 \end{cases}$$

CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE

ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS
CALL OR WHATSAPP: 689 45 44 70

Cartagena99

Recursion

- A function or script is recursive when a call to itself is included in its code. The call can be direct:

```
function functionA()  
    functionA();  
end
```

or indirect:

```
function functionA()  
    functionB();  
end
```

```
function functionB()  
    functionA();  
end
```

- A recursive function includes of 2 different execution paths

- One invoking the own function (recursion)

Recursion Example

```
numberVal = input('Introduce a number');  
rdo = factorial(numberVal);  
fprintf('The factorial of that number is %d', rdo);
```

Test.m

```
function [factVal]= factorial(n)  
% Function to compute the factorial of a number  
  
    if (n >1)  
        factVal = n* factorial (n-1);  
    else  
        factVal = 1;
```

Fundamental rules of recursion

- *Base cases.* You must **always** have some base case where the function can do its job without making a recursive call. **Always specify a base case otherwise indefinite recursive will occur.**
- *Always make progress.* For the cases that are to be solved recursively, the recursive call must always be to a case that makes progress toward a base case.
