## 2.1. ANNUITY

### 2.1.1. CONCEPT AND ELEMENTS

Annuity refers to multiple Financial capitals (cash flows) associated with different intervals or time periods

$$\{(C_1, t_1), (C_2, t_2), \dots, (C_s, t_s), \dots, (C_n, t_n)\}$$

$C_i$ : Terms of the annuity. They are payments (PMTS) or charges made in the financial Operation.

n: number of DMTC

## 2.1. ANNUITY

### 2.1.2. Financial Value of an annuity

THE FINANCIAL VALUE OF AN ANNUITY IS the sum of all cash flows or PMTS , valued at the same point in time (Compounded or discounted) based on a particular Financial Law.

$$V_\alpha = \sum_{k=1}^n C_k (1+i)^{\alpha-t_k}$$

## 2.2. COMPOUND FINANCIAL OPERATION

### 2.2.1. Definition

A compound financial Operation is a financial operation in which more than two financial capitals are exchanged (not simultaneously).  
For example: a general case is when two annuities are exchanged.

## 2.2. COMPOUND FINANCIAL OPERATION

### 2.2.2. FINANCE EQUIVALENCE PRINCIPLE

In every financial operation annuities on both sides must be financially equivalent based on a financial Law. That 's to say that the financial values of both parts must be financially equivalent in accordance with the aforementioned Law

In every financial operation the financial value of one part must coincide with the financial value of the other part in the same point, based on a financial Law.

## 2.3. FINANCIAL PERIODIC ANNUITIES

### 2.1.1. The concept:

We consider a financial annuity to be periodic when the time period that exists between its terms or cash-flows is always the same.

Therefore, every cash-flow is associated with an interval which lasts the same amount of time.

#### EXAMPLES OF PERIODIC ANNUITIES

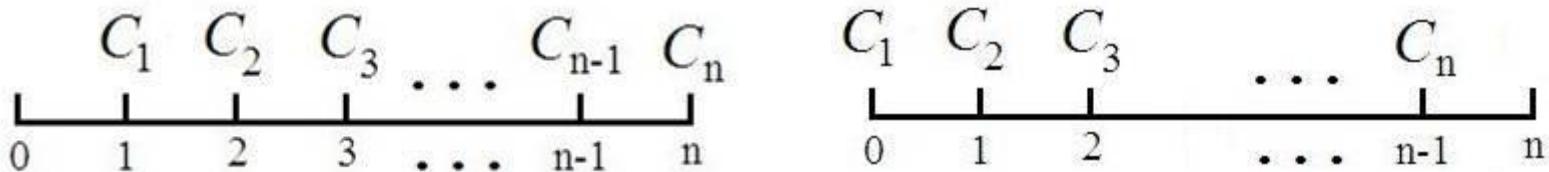

NOTE: The maturity of the annuity's cash flows can be any period of time. For instance at the beginning, middle or the end of the interval.

## 2.2.2. ELEMENTS OF A PERIODIC ANNUITY

- **ORIGIN:** inferior end of the interval associated with the expiration of the first cash flow.
- **END:** superior end of the interval associated with the expiration of the last cash flow.
- **DURATION:** time period elapsed between the beginning and the end of the annuity.
- **C:** Annuity's terms (cash flows) .
- **n:** number of cash flows of an annuity.
- **i:** type of interest rate (Always Compound Interest Law)

## 2.2.3. CLASSIFICATION OF PERIODIC ANNUITIES

### 2.2.3. CLASSIFICATION

2.2.3.1. According to the maturity of the cash flows

2.2.3.2. According to the quantity of the cash flows

2.2.3.3. According to the duration of the annuity

2.2.3.4. According to the moment of valuation

## 2.2.3.1. CLASSIFICATION OF PERIODIC ANNUITIES

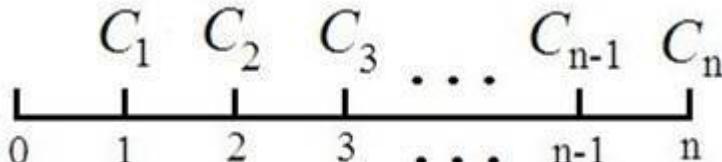

### 1 Classification: According to the maturity of the cash flows

#### ORDINARY ANNUITY

The maturity of the quantities is at the end of the period

*The beginning of the annuity: the period before the maturity of the first PMT*

*The end of annuity : coincides with the maturity of the last PMT*

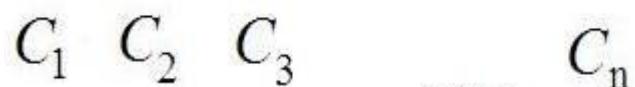

#### ANNIUTY DUE:

The maturity of the cash flows is at the beginning of every period

*The beginning of annuity: coincides with the maturity of the first PMT*

*The end of an annuity is (located) one period after the maturity of the last PMT*

CALL OR WHATSAPP: 689 45 44 70

## 2.2.3.2. CLASSIFICATION OF PERIODIC ANNUITIES

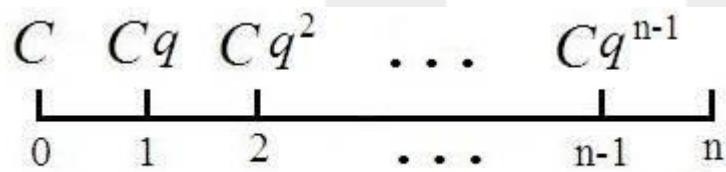

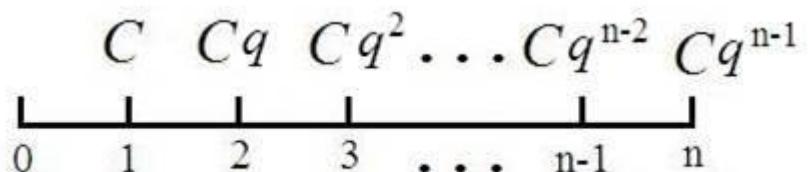

### 2 Classification: According to the Quantity of the PMTS

**CONSTANT ANNUITIES:** Are those in which the quantity of all cash –flows is the same

**GEOMETRIC ANNUITIES (Variable Cash-Flows)**

Are those in which the C-FS vary geometrically (the PMTS increase or decrease at a percentage related to the previous percentage)

**Cartagena99**

LLAMA O ENVÍA WHATSAPP: 689 45 44 70

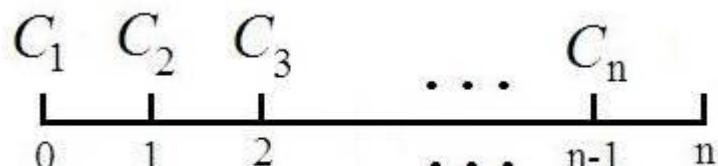

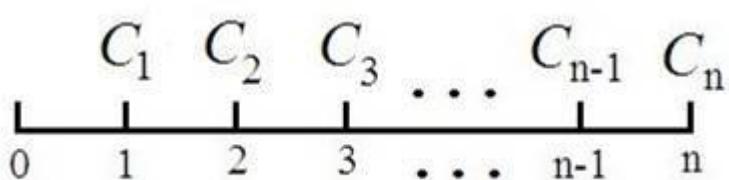

ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS  
CALL OR WHATSAPP: 689 45 44 70

## 2.2.3.3. CLASSIFICATION OF PERIODIC ANNUITIES

### 3 Classification: According to the Duration of the Annuity

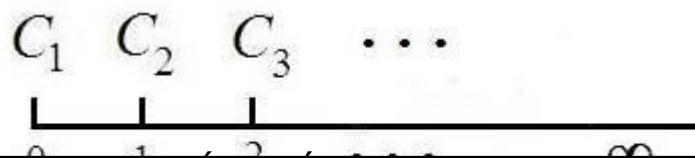

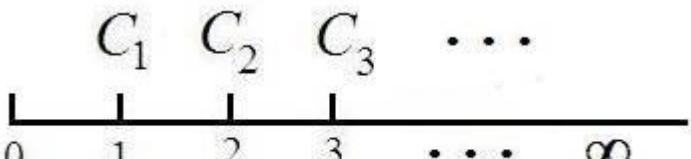

#### TEMPORARY ANNUITIES.

The number of the terms is finite

#### PERPETUAL ANNUITIES.

The number of the terms tends toward infinity

LLAMA O ENVÍA WHATSAPP: 689 45 44 70

ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS  
CALL OR WHATSAPP: 689 45 44 70

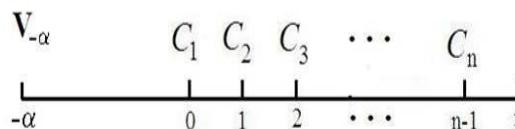

## 2.2.3.4. CLASSIFICATION OF PERIODIC ANNUITIES

### 4 Classification: According to the moment of annuity valuation

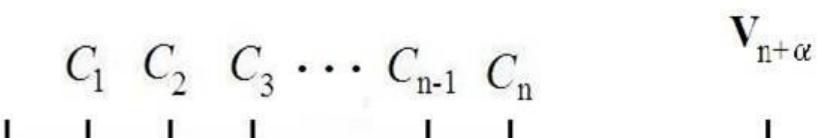

The point of valuation is found between the origin and the end of annuity

The point of valuation is previous to the origin of the annuity

The point of valuation is after the end of the annuity

# FINANCIAL VALUES OF SOME PARTICULAR ANNUITIES

## Some Ideas

- The Financial Law applied to Annuities is Compound Interest Law at a Constant Interest Rate.
- PRESENT VALUE OR DISCOUNTED VALUE (valuation of the annuity at origin)

We are calculating the financial value of the annuity at the beginning.  $t = 0$

### Future Value ( Valuation of the annuity at the end)

We are calculating the financial value of the annuity at the end.  $t=n$
