\*  $\eta$  is the similarity variable defined in Eq. 4 above, and function  $f(\eta)$  is solved using the Runge-Kutta numerical technique. Note that  $f''$  is proportional to the shear stress  $\tau$ ,  $f'$  is proportional to the  $x$ -component of velocity in the boundary layer ( $f' = u/U$ ), and  $f$  itself is proportional to the stream function.  $f'$  is plotted as a function of  $\eta$  in Fig. 10-99.
