Network Layer II-1

RSC Part III: Transport Layer

- III. 1 Basic Transport layer concepts
 - Transport layer Principles
 - Transport layer Services
 - Multiplexing and Demultiplexing
- III.3 TCP
 - TCP connection
 - TCP Segment, sequence and ack numbers
 - RTT Estimation and Timeout
 - Reliable Data Transfer
 - Flow Control
 - TCP connection

□ III.2 UDP

Transport services and protocols

- provide *logical communication* between app processes running on different hosts
- transport protocols run in end systems
 - send side: breaks app messages into **segments**, passes to network layer
 - rcv side: reassembles segments into messages, passes to app layer
- more than one transport protocol available to apps
 - Internet: TCP and UDP

Transport Layer 3-3

Transport vs. network layer

- *network layer*: logical communication between hosts
- *transport layer*: logical communication between processes
 - relies on, enhances, network layer services

Household analogy:

12 kids sending letters to 12 kids

- processes = kids
- app messages = letters in envelopes
- hosts = houses
- transport protocol =

Internet transport-layer protocols

- ❑ reliable, in-order delivery: TCP
 - congestion control
 - flow control
 - connection setup
- ❑ unreliable, unordered delivery: UDP
 - no-frills extension of "best-effort" IP
- ❑ services not available:
 - delay guarantees
 - bandwidth guarantees

Transport Layer 3-5

RSC Part III: Transport Layer

- ❑ III. 1 Basic Transport layer concepts
 - Transport layer Principles
 - Transport layer Services
 - Multiplexing and Demultiplexing
- ❑ III.3 TCP
 - TCP connection
 - TCP Segment, sequence and ack numbers
 - RTT Estimation and Timeout
 - Reliable Data Transfer
 - Flow Control
 - TCP connection

❑ III.2 UDP

Multiplexing/demultiplexing

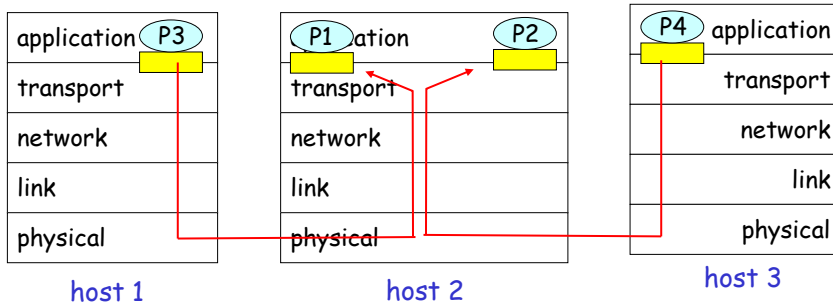

Demultiplexing at rcv host:

delivering received segments to correct socket

Multiplexing at send host:

gathering data from multiple sockets, enveloping data with header (later used for demultiplexing)

■ = socket ○ = process

Transport Layer 3-7

How demultiplexing works

- host receives IP datagrams
 - each datagram has source IP address, destination IP address
 - each datagram carries 1 transport-layer segment
 - each segment has source, destination port number
- host uses IP addresses & port numbers to direct segment to appropriate socket

Cartagena99

Connectionless demultiplexing

- Create sockets with port numbers:

```
DatagramSocket mySocket1 = new  
DatagramSocket(12534);
```

```
DatagramSocket mySocket2 = new  
DatagramSocket(12535);
```

- UDP socket identified by two-tuple:

(dest IP address, dest port number)

- When host receives UDP segment:

- checks destination port number in segment
- directs UDP segment to socket with that port number

- IP datagrams with different source IP addresses and/or source port numbers directed to same socket

Transport Layer 3-9

Connectionless demux (cont)

```
DatagramSocket serverSocket = new DatagramSocket(6428);
```

Cartagena99

Connection-oriented demux

- ❑ TCP socket identified by 4-tuple:
 - source IP address
 - source port number
 - dest IP address
 - dest port number
- ❑ recv host uses all four values to direct segment to appropriate socket
- ❑ Server host may support many simultaneous TCP sockets:
 - each socket identified by its own 4-tuple
- ❑ Web servers have different sockets for each connecting client
 - non-persistent HTTP will have different socket for each request

Transport Layer 3-11

Connection-oriented demux (cont)

UDP: User Datagram Protocol [RFC 768]

- "no frills," "bare bones" Internet transport protocol
- "best effort" service, UDP segments may be:
 - lost
 - delivered out of order to app
- *connectionless*:
 - no handshaking between UDP sender, receiver
 - each UDP segment handled independently of others

Why is there a UDP?

- no connection establishment (which can add delay)
- simple: no connection state at sender, receiver
- small segment header
- no congestion control: UDP can blast away as fast as desired

Transport Layer 3-15

UDP: more

- often used for streaming multimedia apps
 - loss tolerant
 - rate sensitive
- other UDP uses
 - DNS
 - SNMP
- reliable transfer over UDP: add reliability at

UDP checksum

Goal: detect "errors" (e.g., flipped bits) in transmitted segment

Sender:

- treat segment contents as sequence of 16-bit integers
- checksum: addition (1's complement sum) of segment contents
- sender puts checksum value into UDP checksum field

Receiver:

- compute checksum of received segment
 - check if computed checksum equals checksum field value:
 - NO - error detected
 - YES - no error detected.
But maybe errors nonetheless? More later
-

Transport Layer 3-17

Internet Checksum Example

- Note
 - When adding numbers, a carryout from the most significant bit needs to be added to the result
- Example: add two 16-bit integers

```
1 1 1 0 0 1 1 0 0 1 1 0 0 1 1 0
1 1 0 1 0 1 0 1 0 1 0 1 0 1 0 1
```
