

# Euclidean space

## Basic concepts

We define the Euclidean space  $\mathbb{R}^N$ ,  $N \geq 1$  using cartesian coordinates and geometrical concepts.

Each element  $(x_1, \dots, x_N)$  of  $\mathbb{R}^N$

$$x = (x_1, \dots, x_N)$$

$$x = \sum_{i=1}^N x_i e_i, \quad x_i \in \mathbb{R}$$

In particular in  $\mathbb{R}^3$ ,  $B = \{i, j, k\}$

Properties  $\lambda, \mu \in \mathbb{R}, x, y \in \mathbb{R}^N$

- Linear Space.
- a) Addition of vectors.  
 $(x_1, \dots, x_N) + (y_1, \dots, y_N) = (x_1 + y_1, \dots, x_N + y_N)$
  - b) Multiplication by scalars,  $\lambda \in \mathbb{R}$   
 $\lambda(x_1, \dots, x_N) = (\lambda x_1, \dots, \lambda x_N)$
  - c)  $(\mu\lambda)(x_1, \dots, x_N) = \mu(\lambda x_1, \dots, \lambda x_N)$
  - d)  $(\mu + \lambda)x = \mu x + \lambda x$  | f)  $0 \cdot x = 0 \in \mathbb{R}^N$

## Remark

What is  $b-a$ ?  $a, b \in \mathbb{R}^n$

analytically  
 $a + (b-a) = b$

## Property

The Euclidean space  $\mathbb{R}^n$  is a normed space

It has an associated norm

$$\| \cdot \| : \mathbb{R}^n \rightarrow \mathbb{R}$$

CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE  
LLAMA O ENVÍA WHATSAPP: 689 45 44 70

---

Cartagena99

satisfying:

$$a) \forall x \in \mathbb{R}^N \quad \|x\| > 0 \text{ if } x \neq 0 \\ \|x\| = 0 \text{ if } x = 0$$

$$b) \|\lambda x\| = |\lambda| \|x\|, \quad \forall \lambda \in \mathbb{R}, \quad \forall x \in \mathbb{R}^N$$

$$c) \|x+y\| \leq \|x\| + \|y\| \quad \forall x, y \in \mathbb{R}^N$$

Remark

Associated with the norm there exists the function  
"distance between two elements"

$$\text{dist}(x, y) = \|x - y\|, \quad \text{dist}: \mathbb{R}^N \times \mathbb{R}^N \rightarrow \mathbb{R}.$$

$$\text{dist}(x, y) = \|x - y\| \geq 0$$

$$\|a\| = a_x + a_y$$

## Definition - Inner or scalar product

Let  $a, b \in \mathbb{R}^n$  be two vectors in  $\mathbb{R}^n$ . Then the inner product is given by.

$$\begin{aligned} a \cdot b &= a_1 b_1 + \dots + a_n b_n \\ &\parallel \\ \langle a, b \rangle &= (a, b) \end{aligned}$$

Remark

$$\|x\| = \sqrt{\langle x, x \rangle} \equiv \text{length of the vector } x.$$

Properties

a) Positive definite  $\langle x, x \rangle > 0$  if  $x \neq 0$   
 $\langle x, x \rangle = 0$  if  $x = 0$

# Cauchy - Schwarz Inequality

$$|x \cdot y| \leq \|x\| \|y\|$$

Proof If  $y = \lambda x$  (linearly dependant vectors)

$$|\langle x, \lambda x \rangle| = |\lambda \|x\|^2| = |\lambda| \|x\|^2 = \|x\| \|y\|$$

$$\|y\| = |\lambda| \|x\|$$

If  $y \neq \lambda x$  (l.i vectors), we assume

$$z = \lambda x + y, \quad \lambda \in \mathbb{R}.$$

we know that

$$\langle \lambda x + y, \lambda x + y \rangle =$$

CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE

$$= \lambda \|x\|^2 + 2\lambda \langle x, y \rangle + \|y\|^2$$

Cartagena99

Since  $y, x$  are l.i we cannot have real solutions for  $\lambda$ . and then,

$$4(\langle x, y \rangle)^2 - 4\|x\|^2\|y\|^2 \leq 0$$

$$|\langle x, y \rangle| \leq \|x\| \|y\|$$

Geometrical interpretation for the scalar product

Theorem

$$\langle x, y \rangle = \|x\| \|y\| \cos \alpha$$

$\alpha \equiv$  angle between  $x$  and  $y$ .

## Geometric interpretation

To do so, let's start with the triple product

$$a \cdot (b \times c) = (a_1, a_2, a_3) \cdot \left( \begin{matrix} |b_2 b_3|_i - |b_1 b_3|_j + |b_1 b_2|_k \\ c_1 c_2 c_3 \end{matrix} \right)$$

$$= a_1 \begin{vmatrix} b_2 & b_3 \\ c_2 & c_3 \end{vmatrix} - a_2 \begin{vmatrix} b_1 & b_3 \\ c_1 & c_3 \end{vmatrix} + a_3 \begin{vmatrix} b_1 & b_2 \\ c_1 & c_2 \end{vmatrix}$$

$$= \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix} \Rightarrow \text{If } a \in \text{span}\{b, c\}$$

$\underbrace{a \cdot (b \times c) = 0}$

$\uparrow$   
 $b \times c$

Cartagena99

Also

$$\begin{aligned} \boxed{\|b \times c\|^2} &= \begin{vmatrix} b_2 & b_3 \\ c_2 & c_3 \end{vmatrix}^2 + \begin{vmatrix} b_1 & b_3 \\ c_1 & c_3 \end{vmatrix}^2 + \begin{vmatrix} b_1 & b_2 \\ c_1 & c_2 \end{vmatrix}^2 \\ &= (b_2 c_3 - c_2 b_3)^2 + (b_1 c_3 - c_1 b_3)^2 \\ &\quad + (b_1 c_2 - c_1 b_2)^2 \\ &= (b_1^2 + b_2^2 + b_3^2)(c_1^2 + c_2^2 + c_3^2) - (b_1 c_1 + b_2 c_2 + b_3 c_3)^2 \\ &= \|b\|^2 \|c\|^2 - (b \cdot c)^2 = \cancel{\|b\|^2 \|c\|^2} - \|b\|^2 \|c\|^2 \cos^2 \alpha \\ &= \boxed{\|b\|^2 \|c\|^2 \sin^2 \alpha} \end{aligned}$$

Cartagena99

CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE

ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS  
CALL OR WHATSAPP: 689 45 44 70

$$\|b \times c\| = \|b\| \|c\| \sin \alpha = \text{area of parallelogram}$$

## Remark

If  $b \times c$  we choose the positive one.

If  $c \times b = -(b \times c)$  we choose the negative of that vector.

Example: Find the area of a triangle with vertices on the points  $(1, 1)$ ,  $(0, 2)$  and  $(3, 2)$ .

Assume  $\begin{cases} a = i + j \\ b = 2j \end{cases}$ .
